

# Exploring the Dark Universe with XENON

Marc Schumann

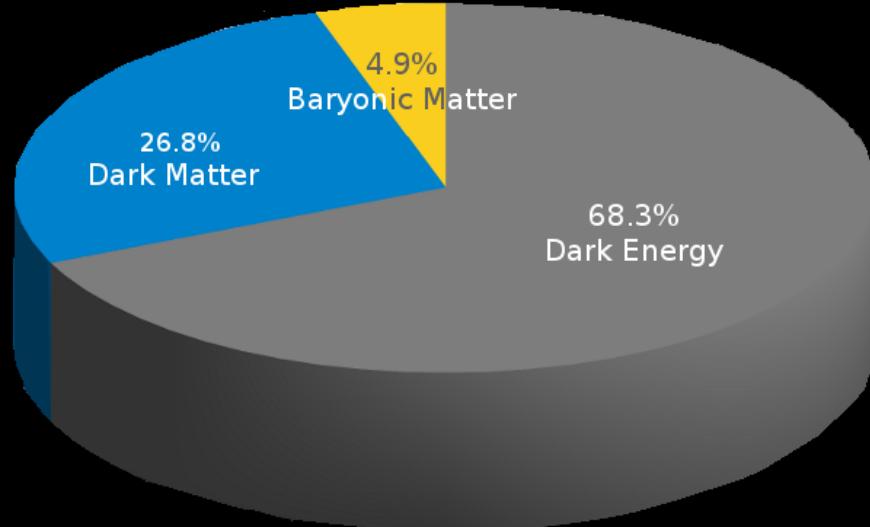

*University of Freiburg*

KIS Colloquium, Freiburg, 20.02.2020

[www.app.uni-freiburg.de](http://www.app.uni-freiburg.de)

UNI  
**FREIBURG**

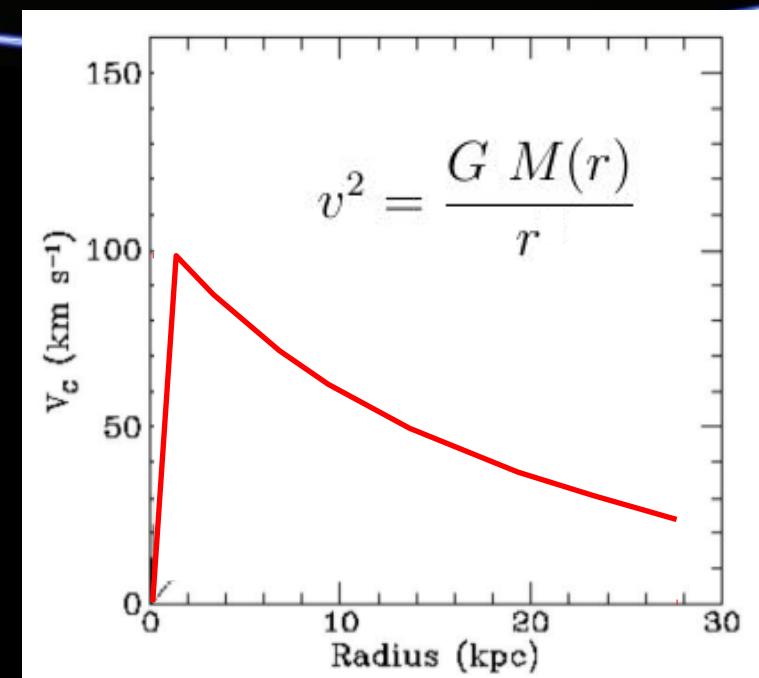

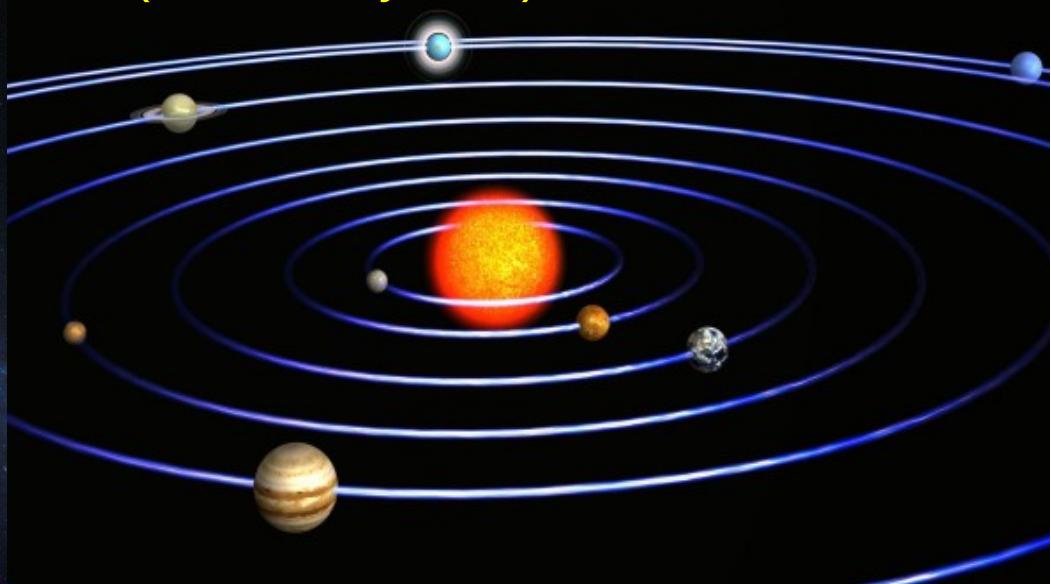

**about 100'00 dark matter particles cross an area of 1 cm<sup>2</sup> per second**

A photograph of a spiral galaxy, likely the Milky Way, showing its central bulge and surrounding disk of stars. The galaxy is oriented diagonally across the frame, with its bright center on the right side.

# **Part 1 – Evidence for Dark Matter**

Expect: Kepler Rotation  
(as solar system)

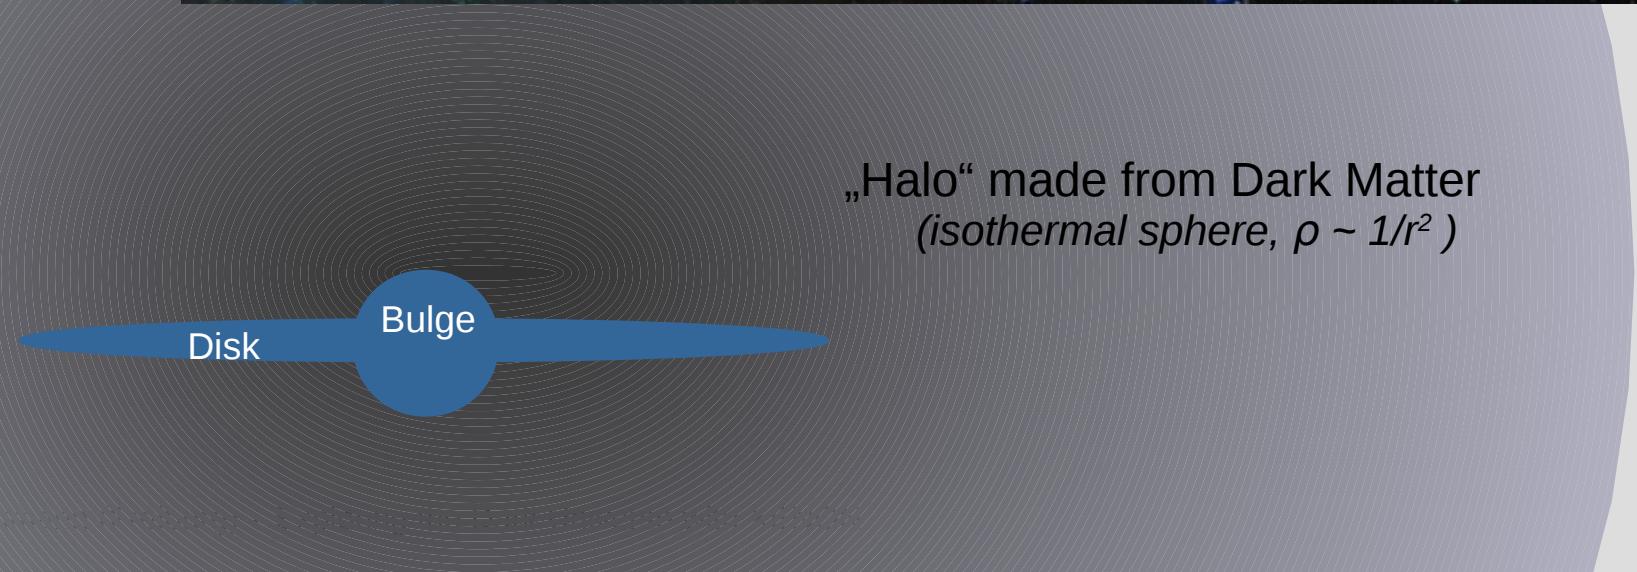

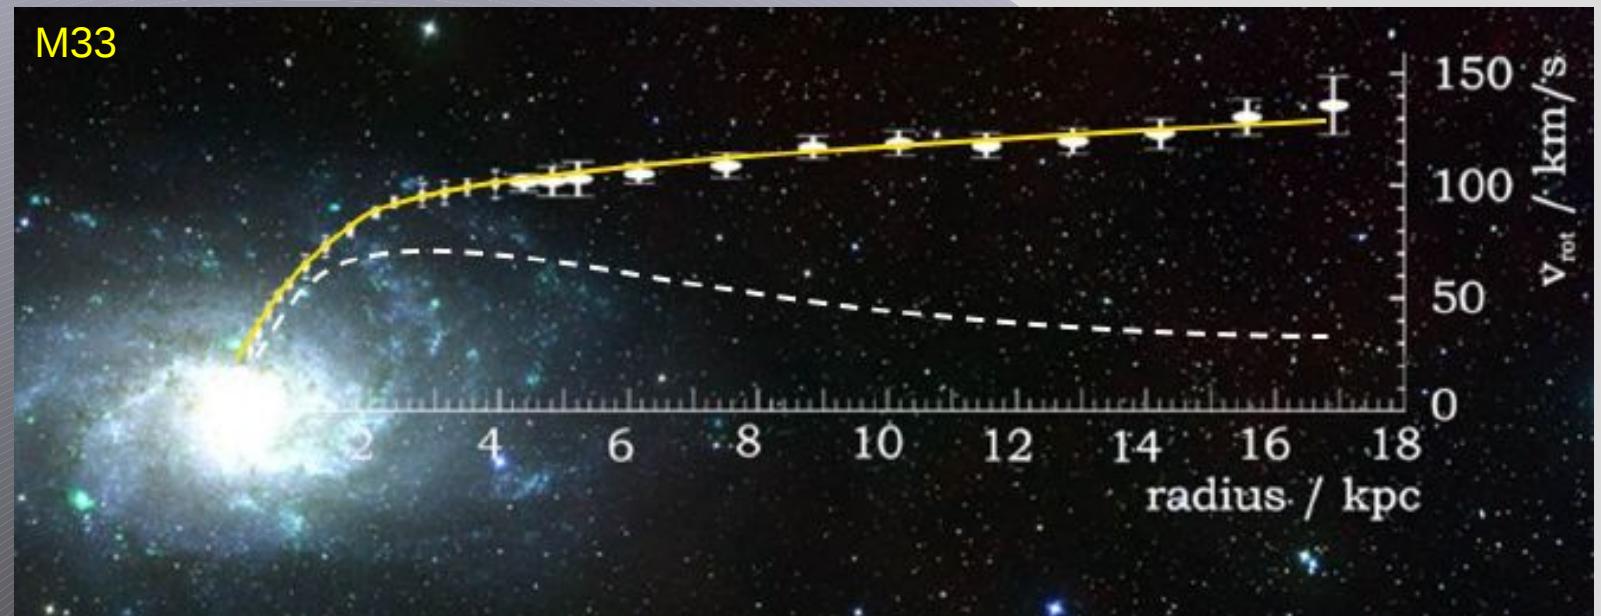

Expectation

Observation

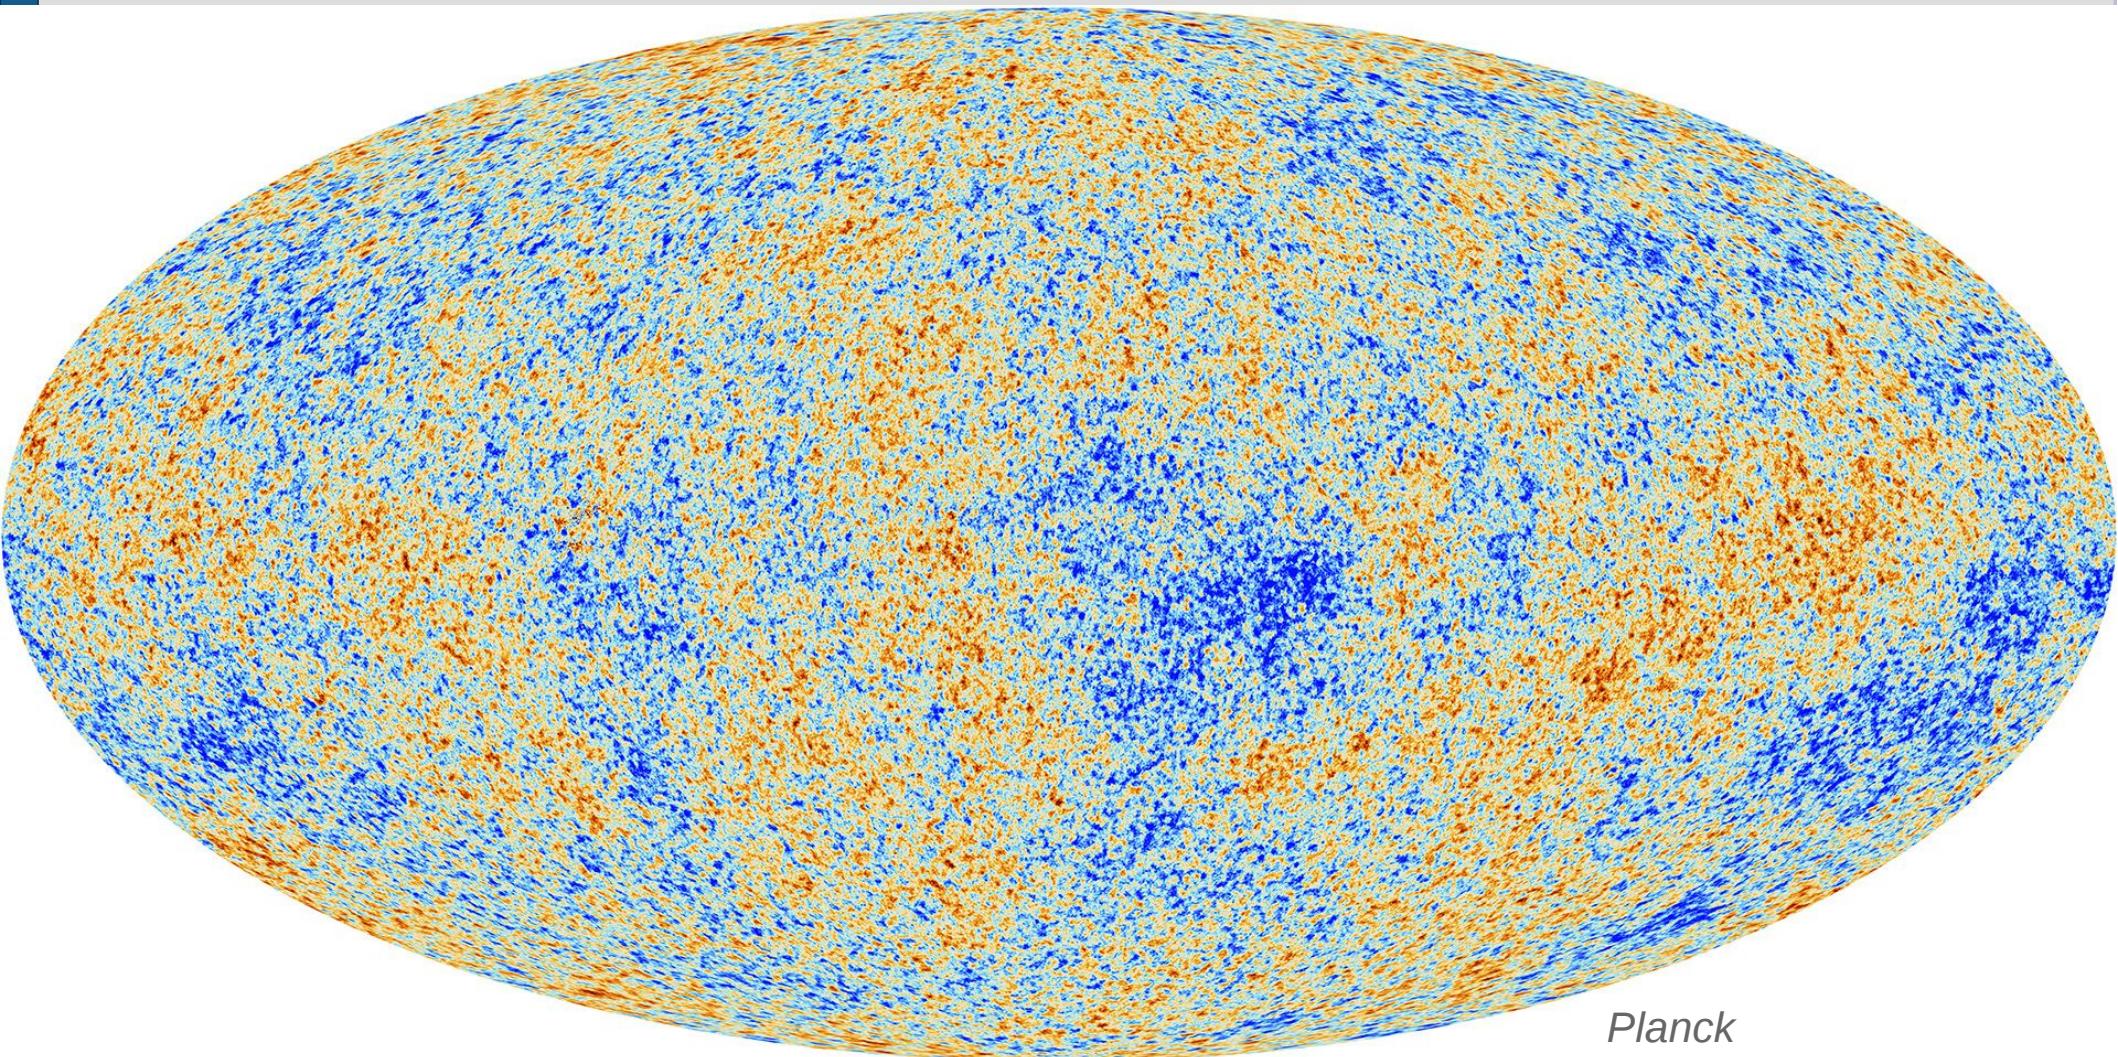

# Galactic Rotation Curves

Measurement: flat rotation profile ... well beyond visible stars

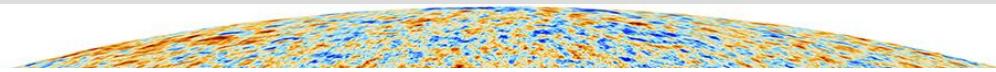

# Cosmic Microwave Background

= afterglow of the hot big bang; variations at  $\Delta T/T \sim 10^{-5}$  level

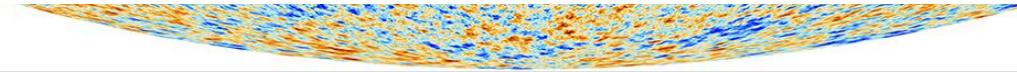

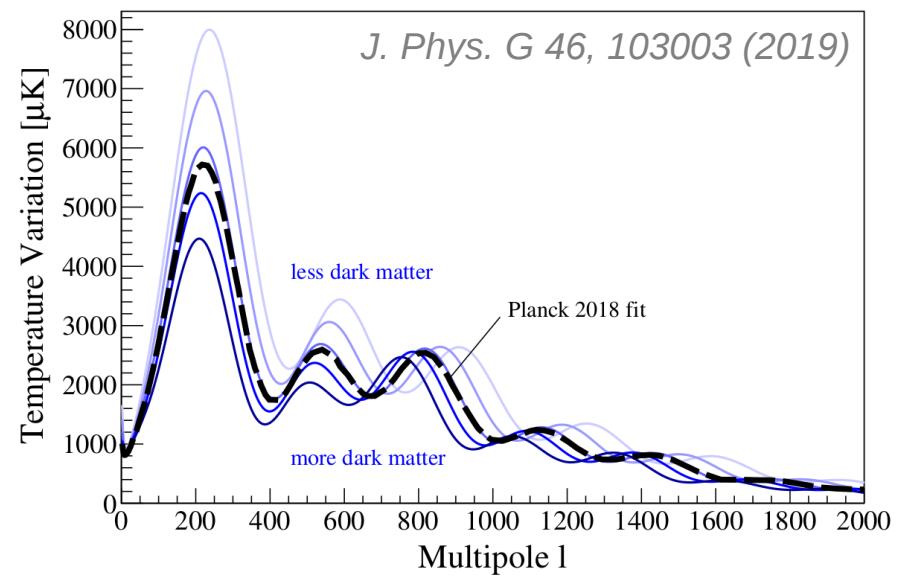

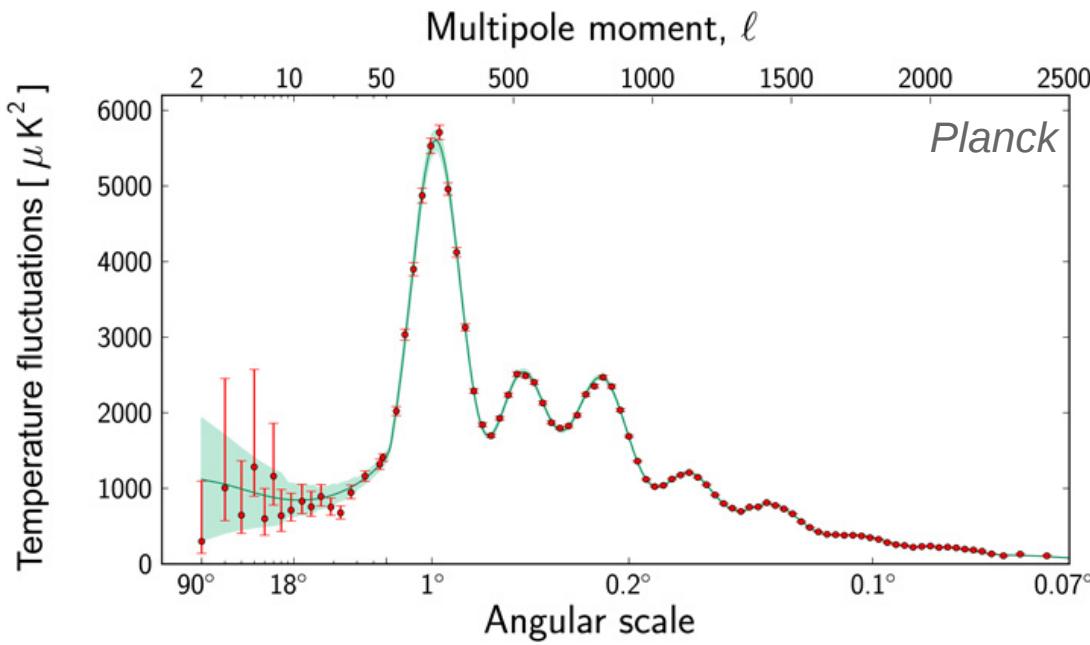

# Cosmic Microwave Background

= afterglow of the hot big bang; variations at  $\Delta T/T \sim 10^{-5}$  level

Correlation Analysis:  
„typical  $T$  variation at typical angular scale“

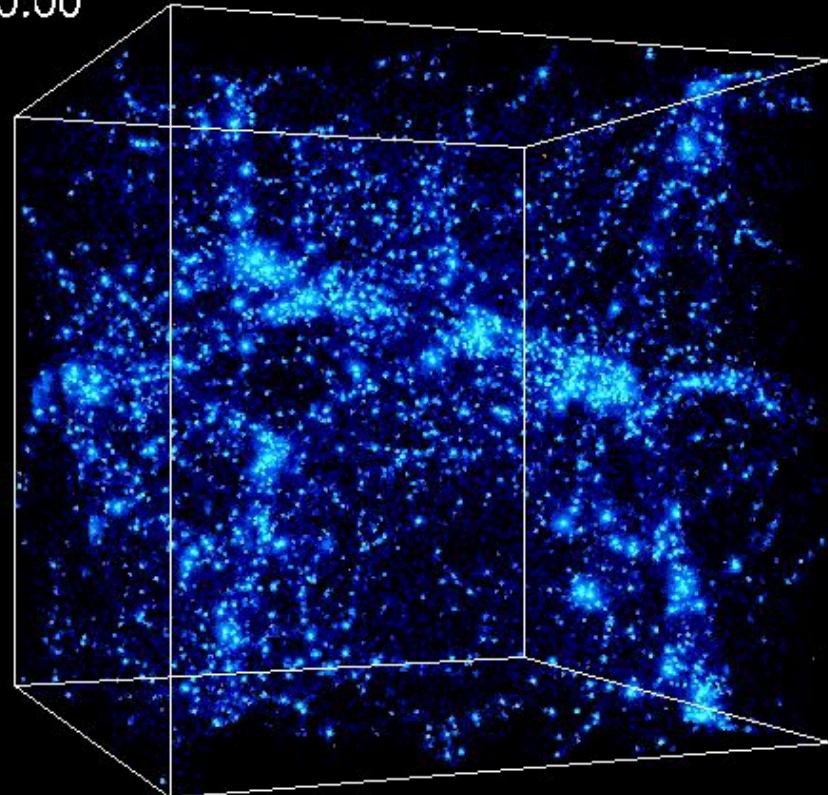

Planck

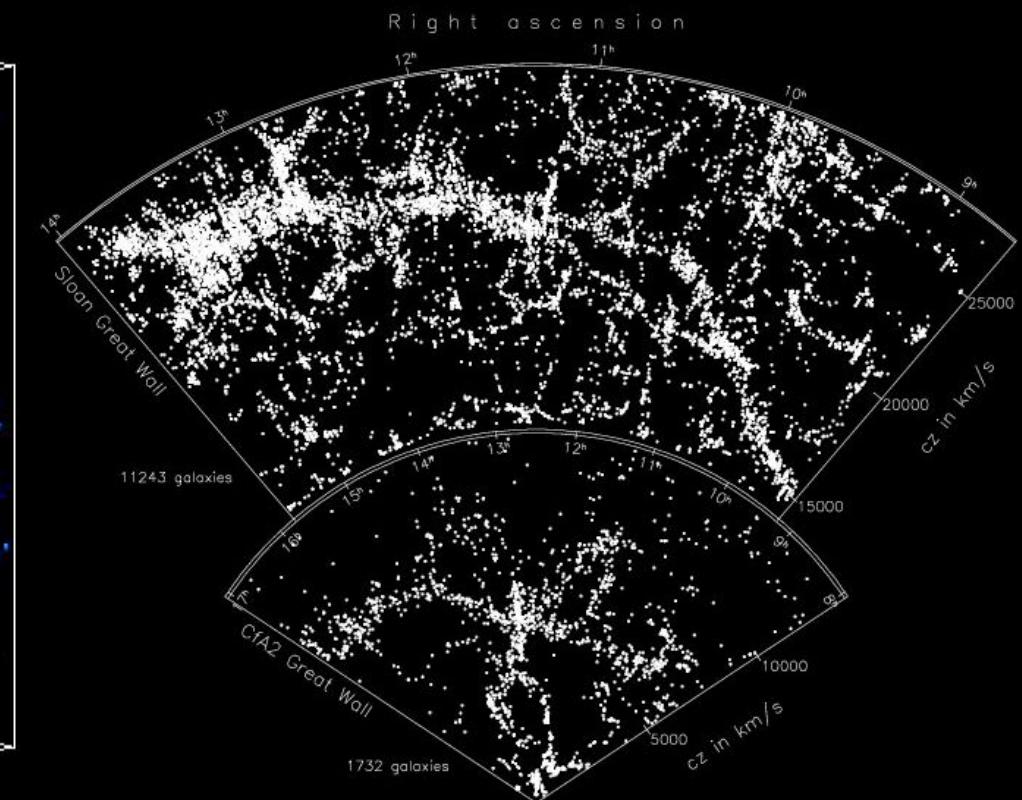

# Dark Matter shapes the Universe

now

$Z = 0.00$

Simulation

Observation (SDSS)

<http://cosmicweb.uchicago.edu>

# WANTED

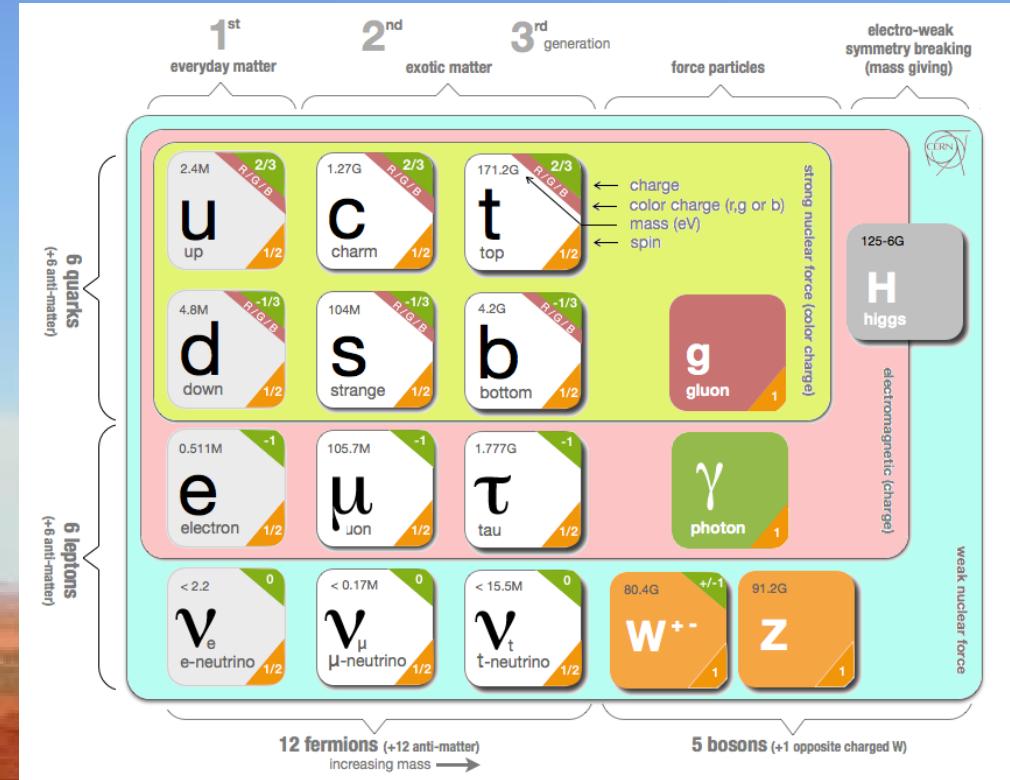

FOR MOVING THE UNIVERSE

# DARK MATTER

Looking for matter with the following properties:

- „invisible“
- „cold“ (= „slow“)
- almost collisionless
- stable

**REWARD: NOBLE PRICE?**

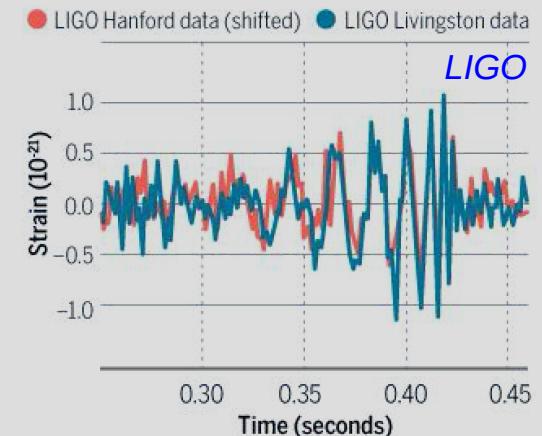

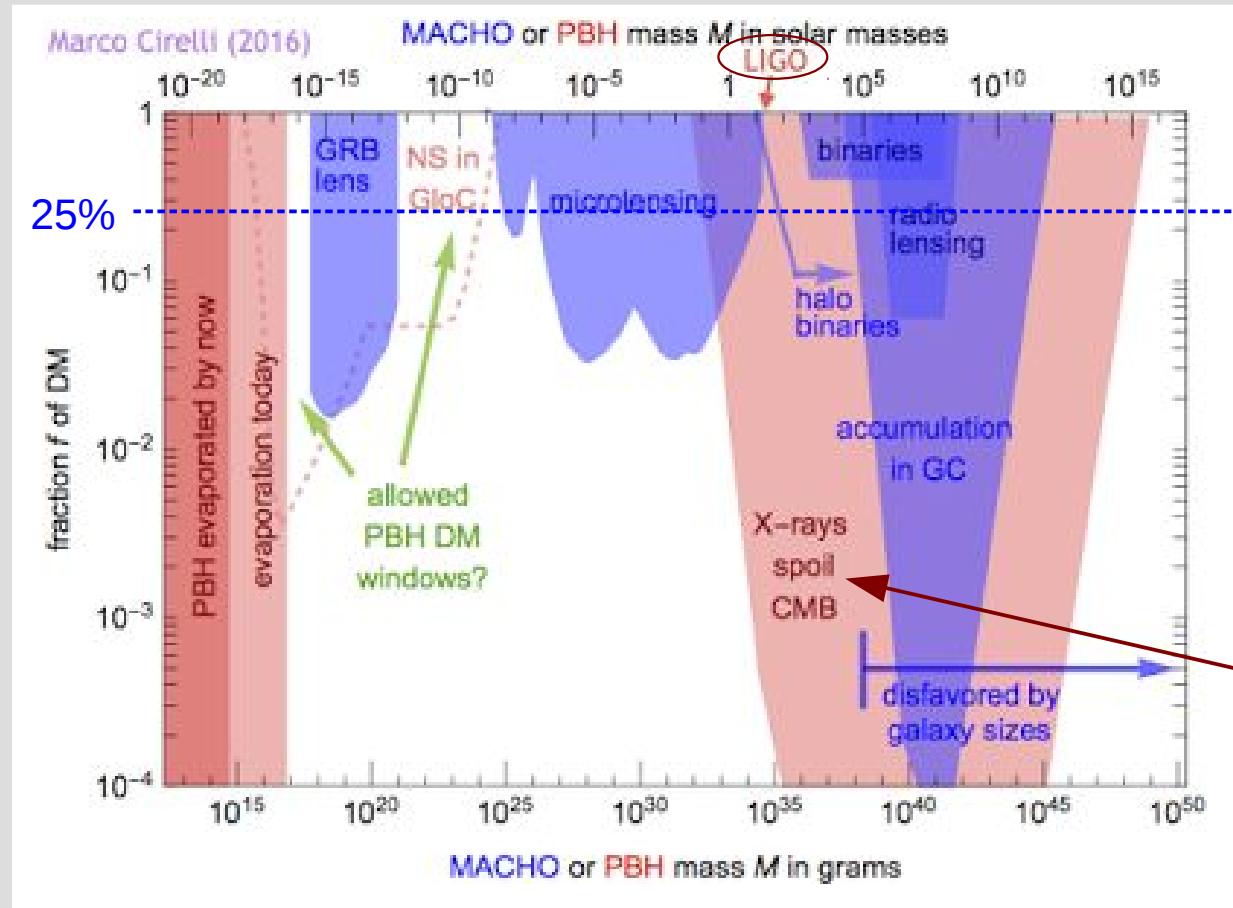

Problem:

no known particle fits the description  
 → **we need to look for something new**  
**weakly interacting massive particle (WIMP)**

# Primordial Black Holes?

Can primordial black holes (PBH) formed in the big bang be the dark matter?

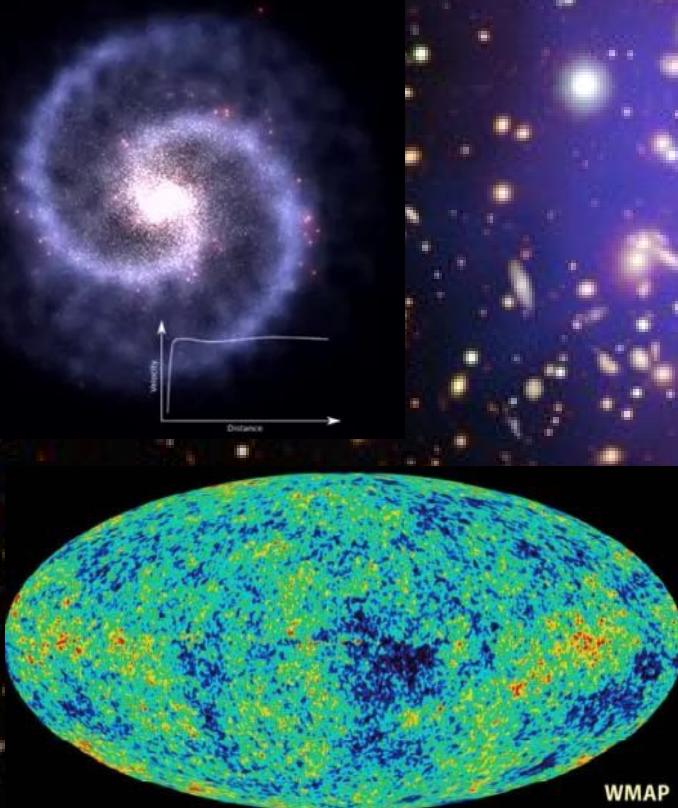

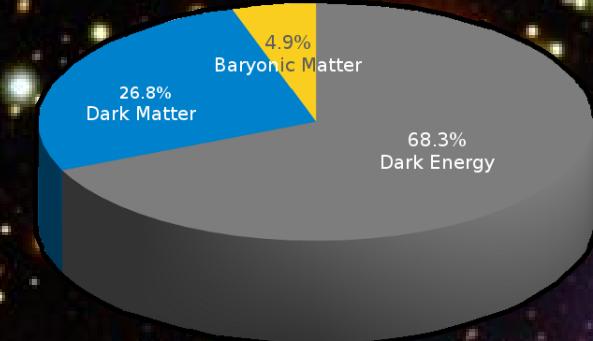

Black holes moving in early dense universe accrete matter and produce X-rays  
 → ionize atoms  
 → affect CMB

constraints in 10-100 Msun range (LIGO):

- **PBHs cannot constitute >0.01% of dark matter**
- but: new discussion about PBH dark matter started  
 maybe PBH not dark matter but faster merger rate

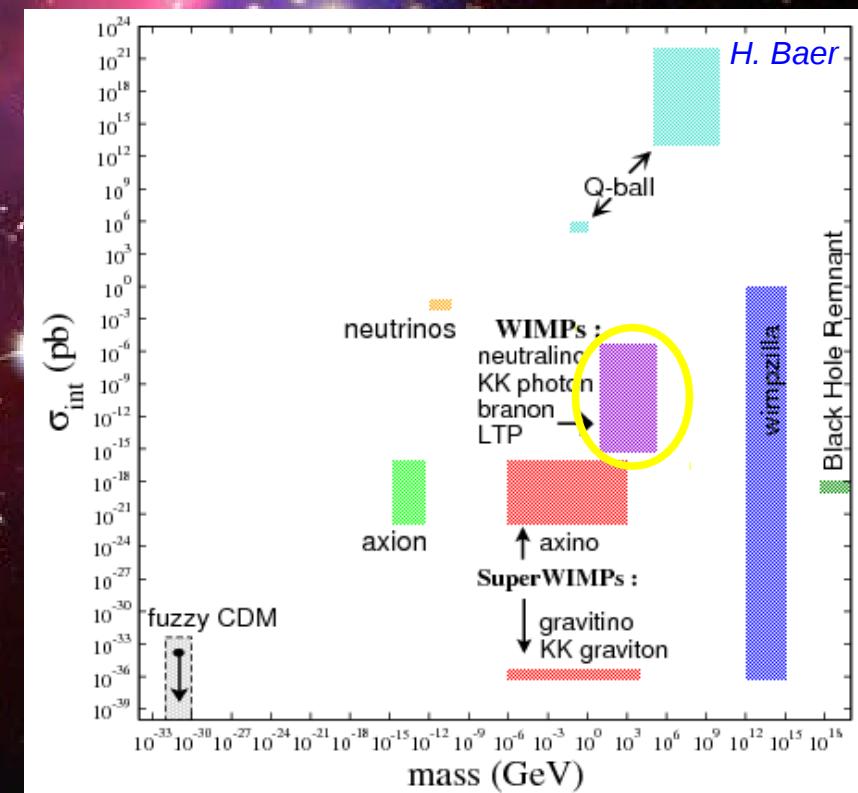

*Astrophys.J. 680, 829 (2008)*  
*PRL 116, 201301 (2016)*  
*PRL 117, 061101 (2016)*

# Dark Matter: (indirect) Evidence

Particle Dark Matter Candidates:

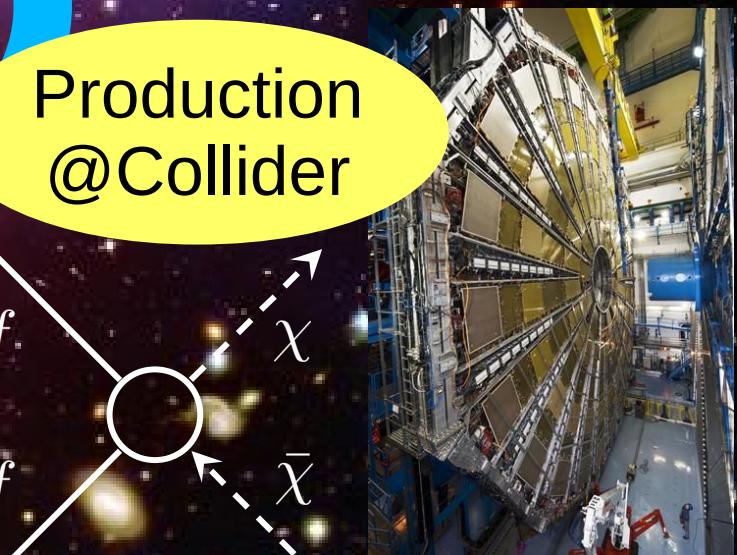

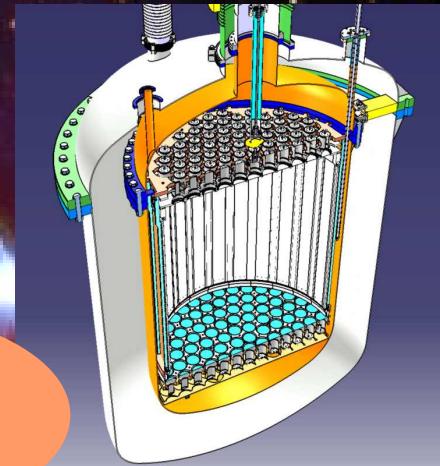

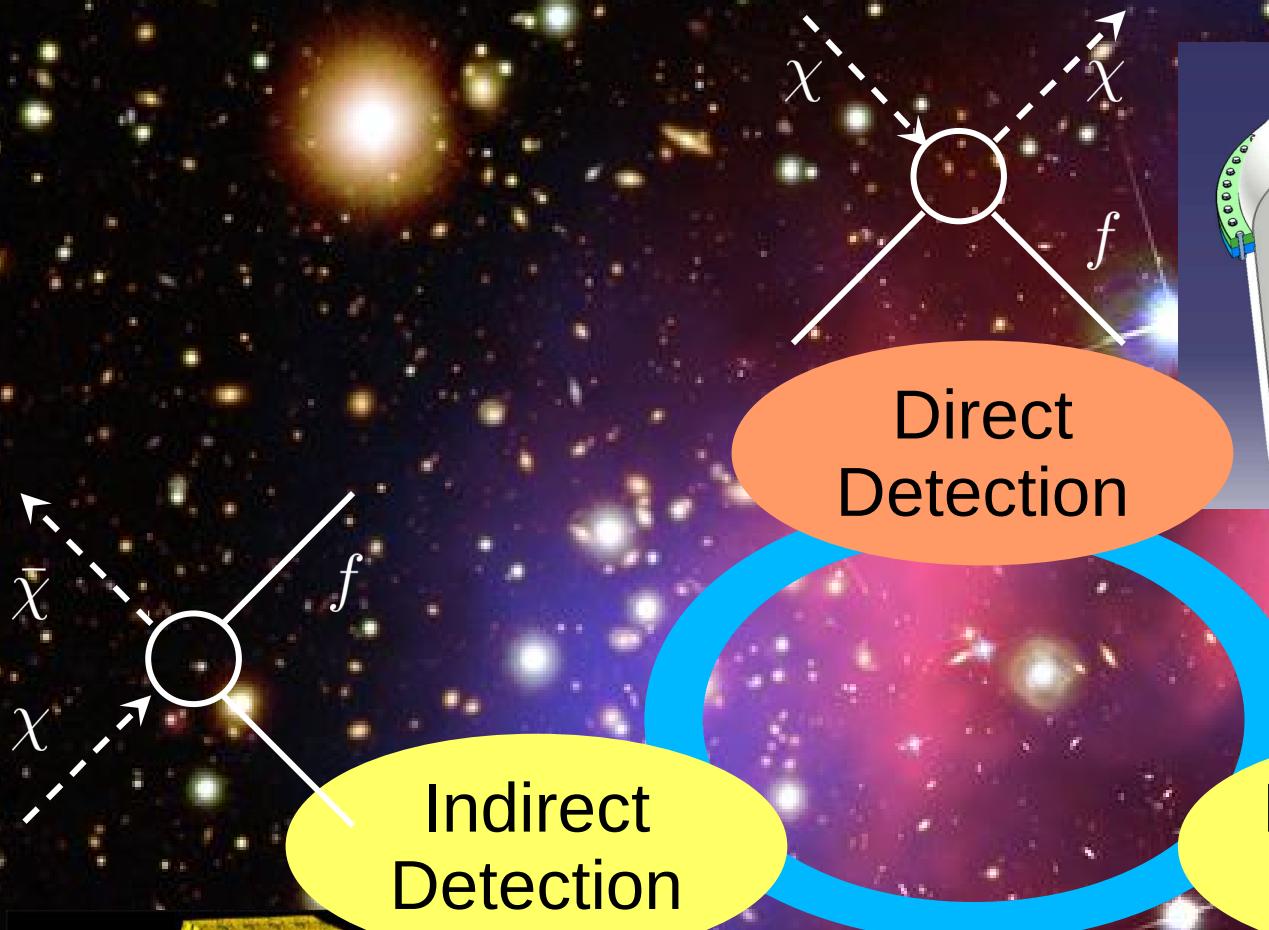

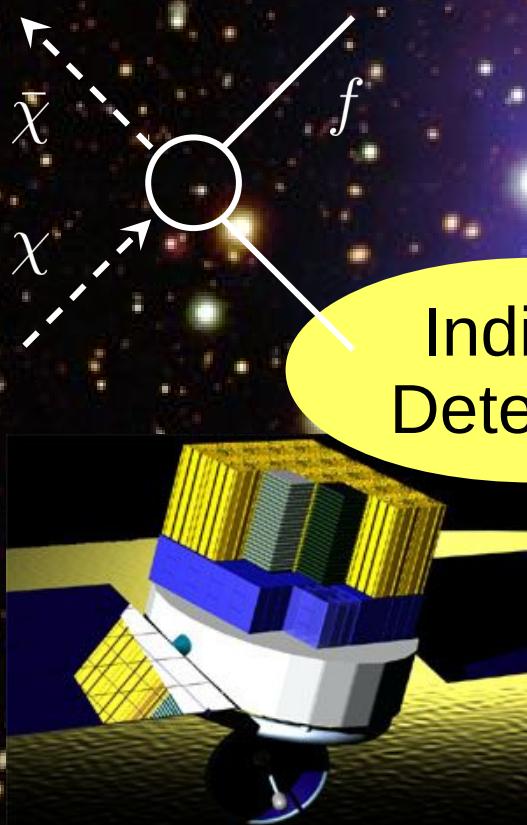

- **WIMP** → „*WIMP miracle*“
- Axion
- SuperWIMPs
- sterile neutrinos
- WIMPless dark matter
- Gravitino
- ...

## **Part 2 – Searching for Dark Matter**

# Dark Matter Search

Cygnus Arm

# Direct WIMP Search

Carina-Sagittarius Arm

Norma Arm

Crux-Scutum Arm

Perseus Arm

**How much dark matter is here?**  
canonical value:  $\sim 0.3 \text{ GeV/cm}^3$

<- Our Solar System

Local or Orion Arm

10 000

20 000

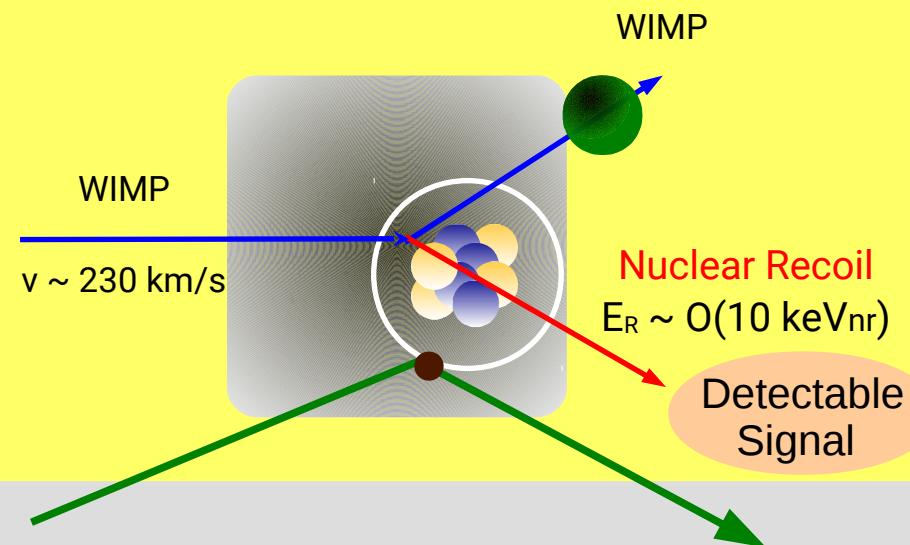

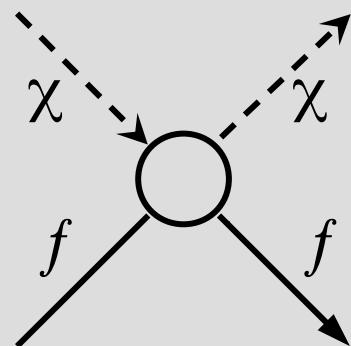

30 000

40 000

50 000

# Direct WIMP Search

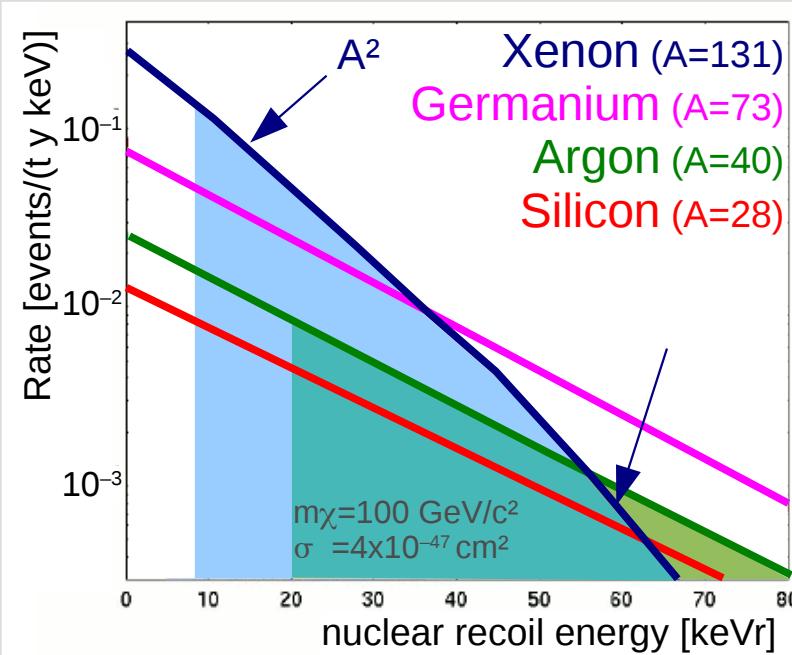

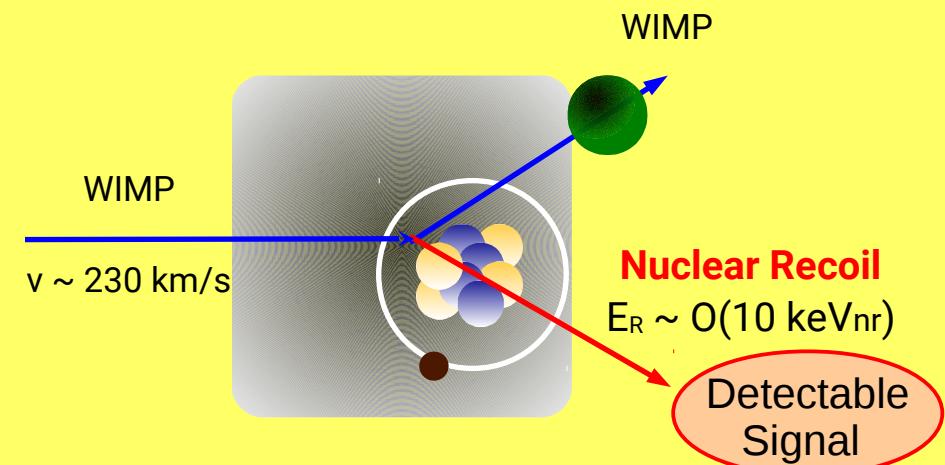

Elastic Scattering of  
WIMPs off target nuclei  
→ nuclear recoil

gamma- and beta-particles  
(background) interact with the  
atomic electrons  
→ **electronic recoil** [in keVee]

# Direct WIMP Search

Elastic Scattering of  
WIMPs off target nuclei  
→ nuclear recoil

Event rate

$$R \propto N \frac{\rho_\chi}{m_\chi} \langle \sigma_{\chi-N} \rangle$$

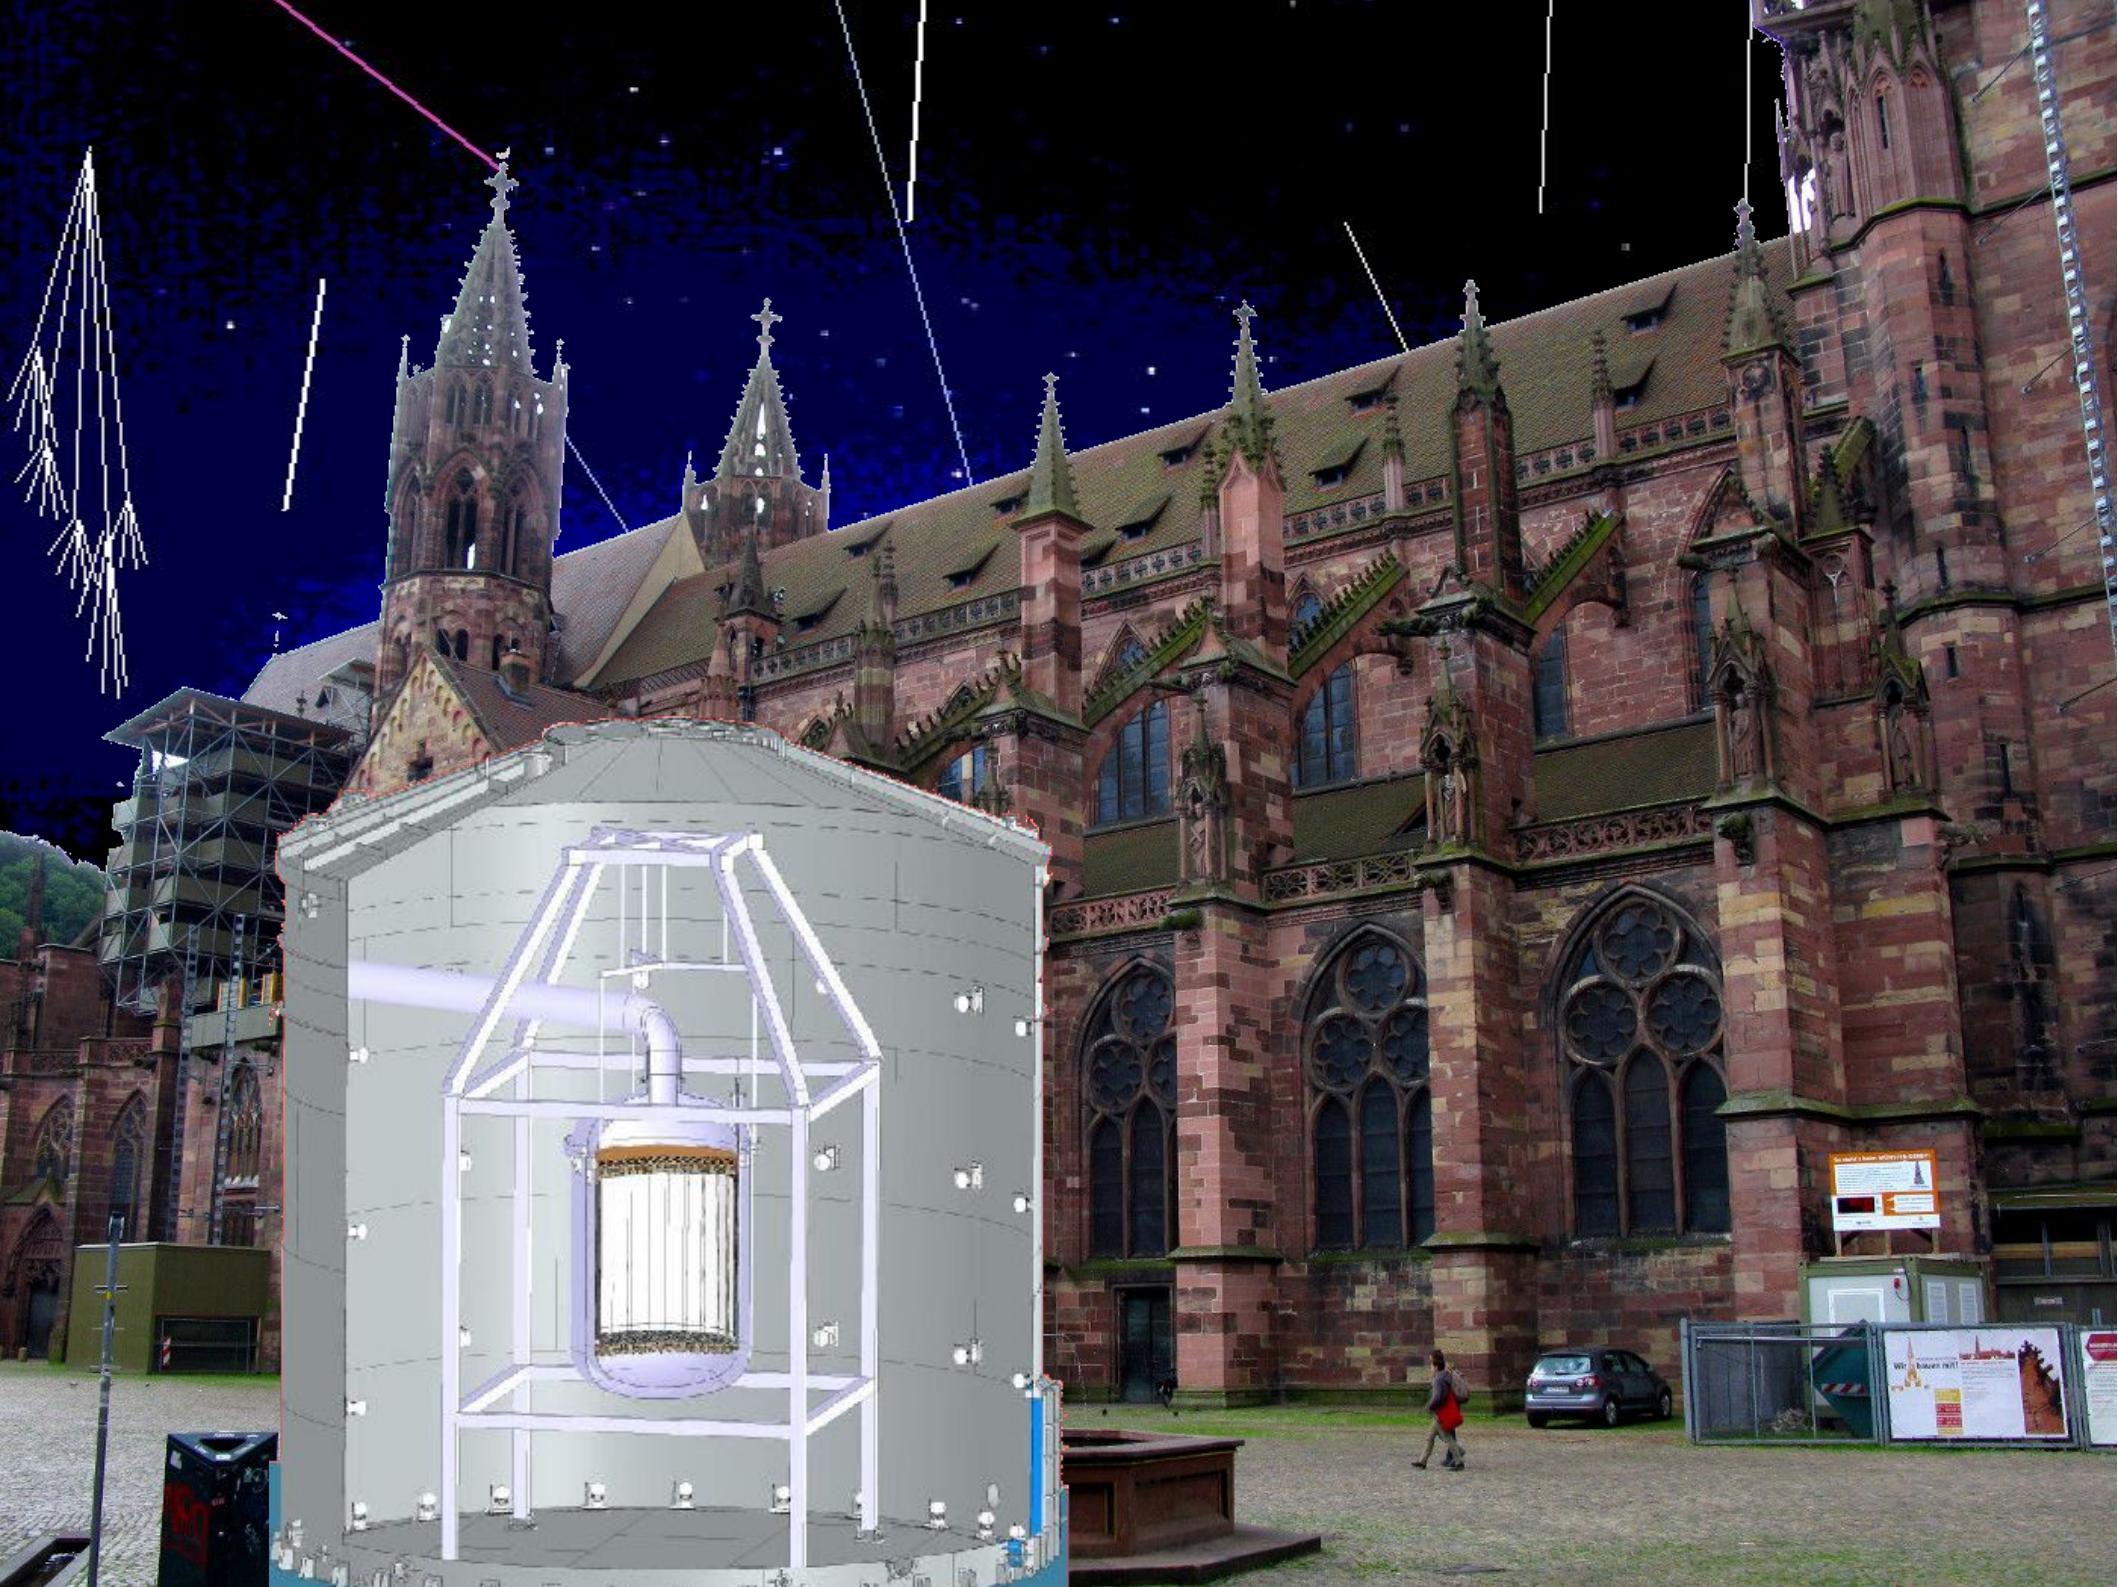

Detector

Local DM Density

Physics

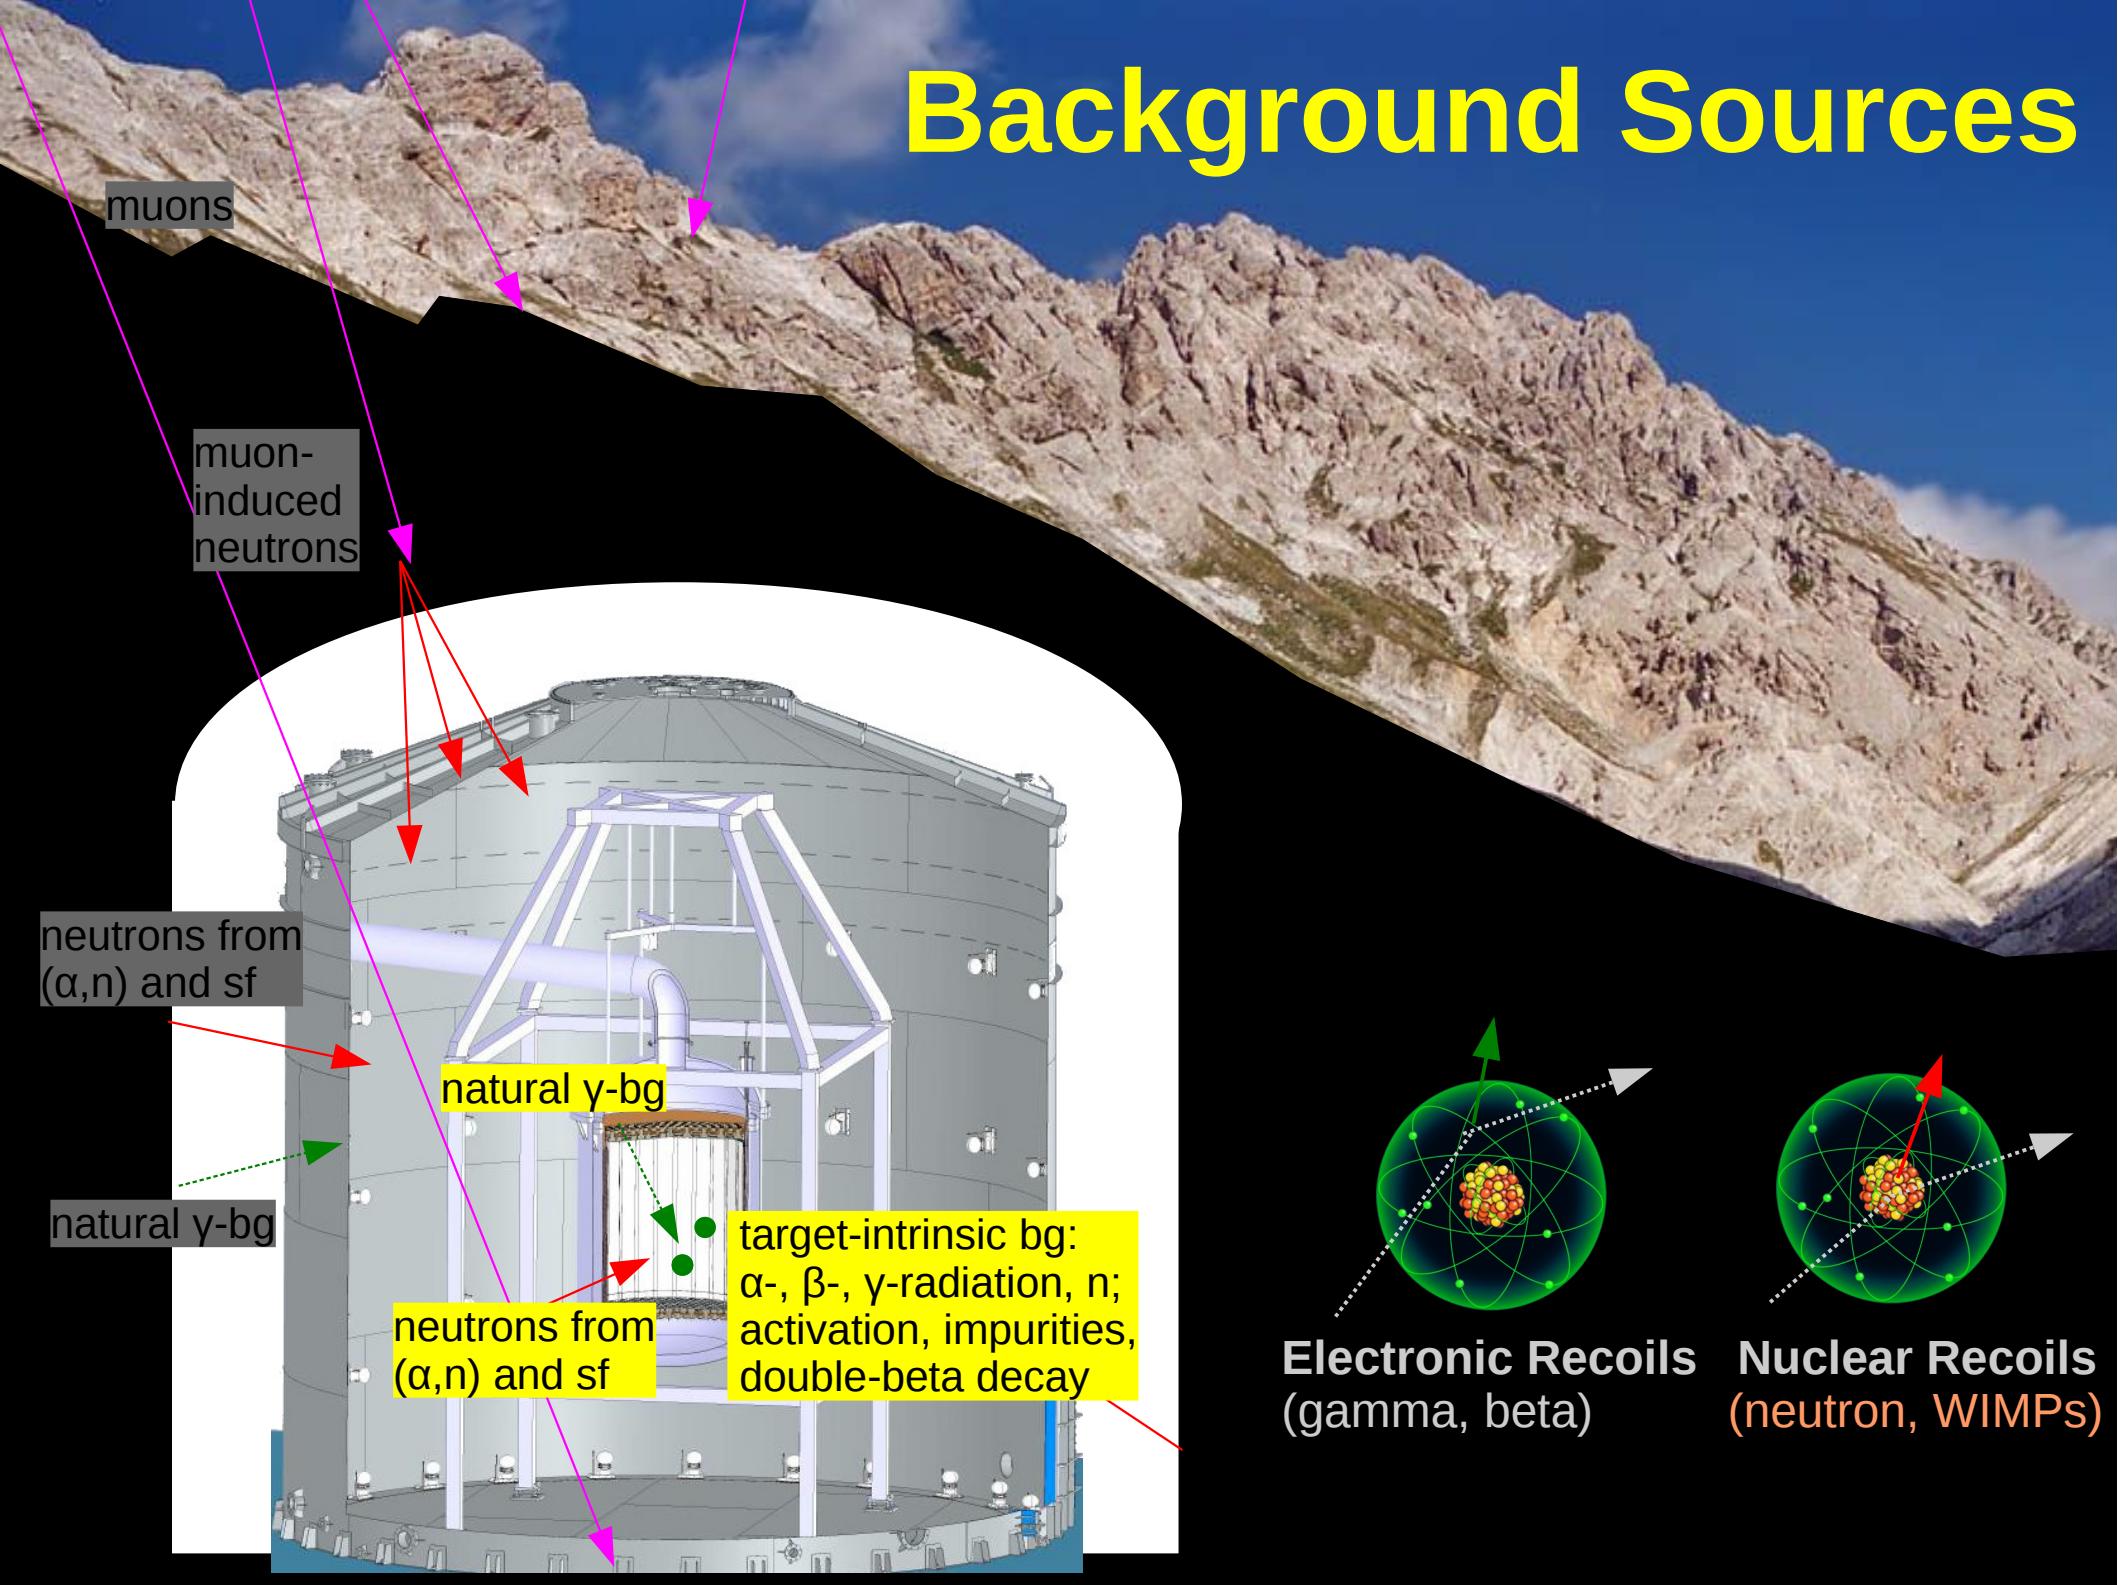

$$\rho_\chi \sim 0.3 \text{ GeV}/c^2$$

- very small:  $\ll 1$  event/kg/year
- search for rare events
- **low-background crucial**

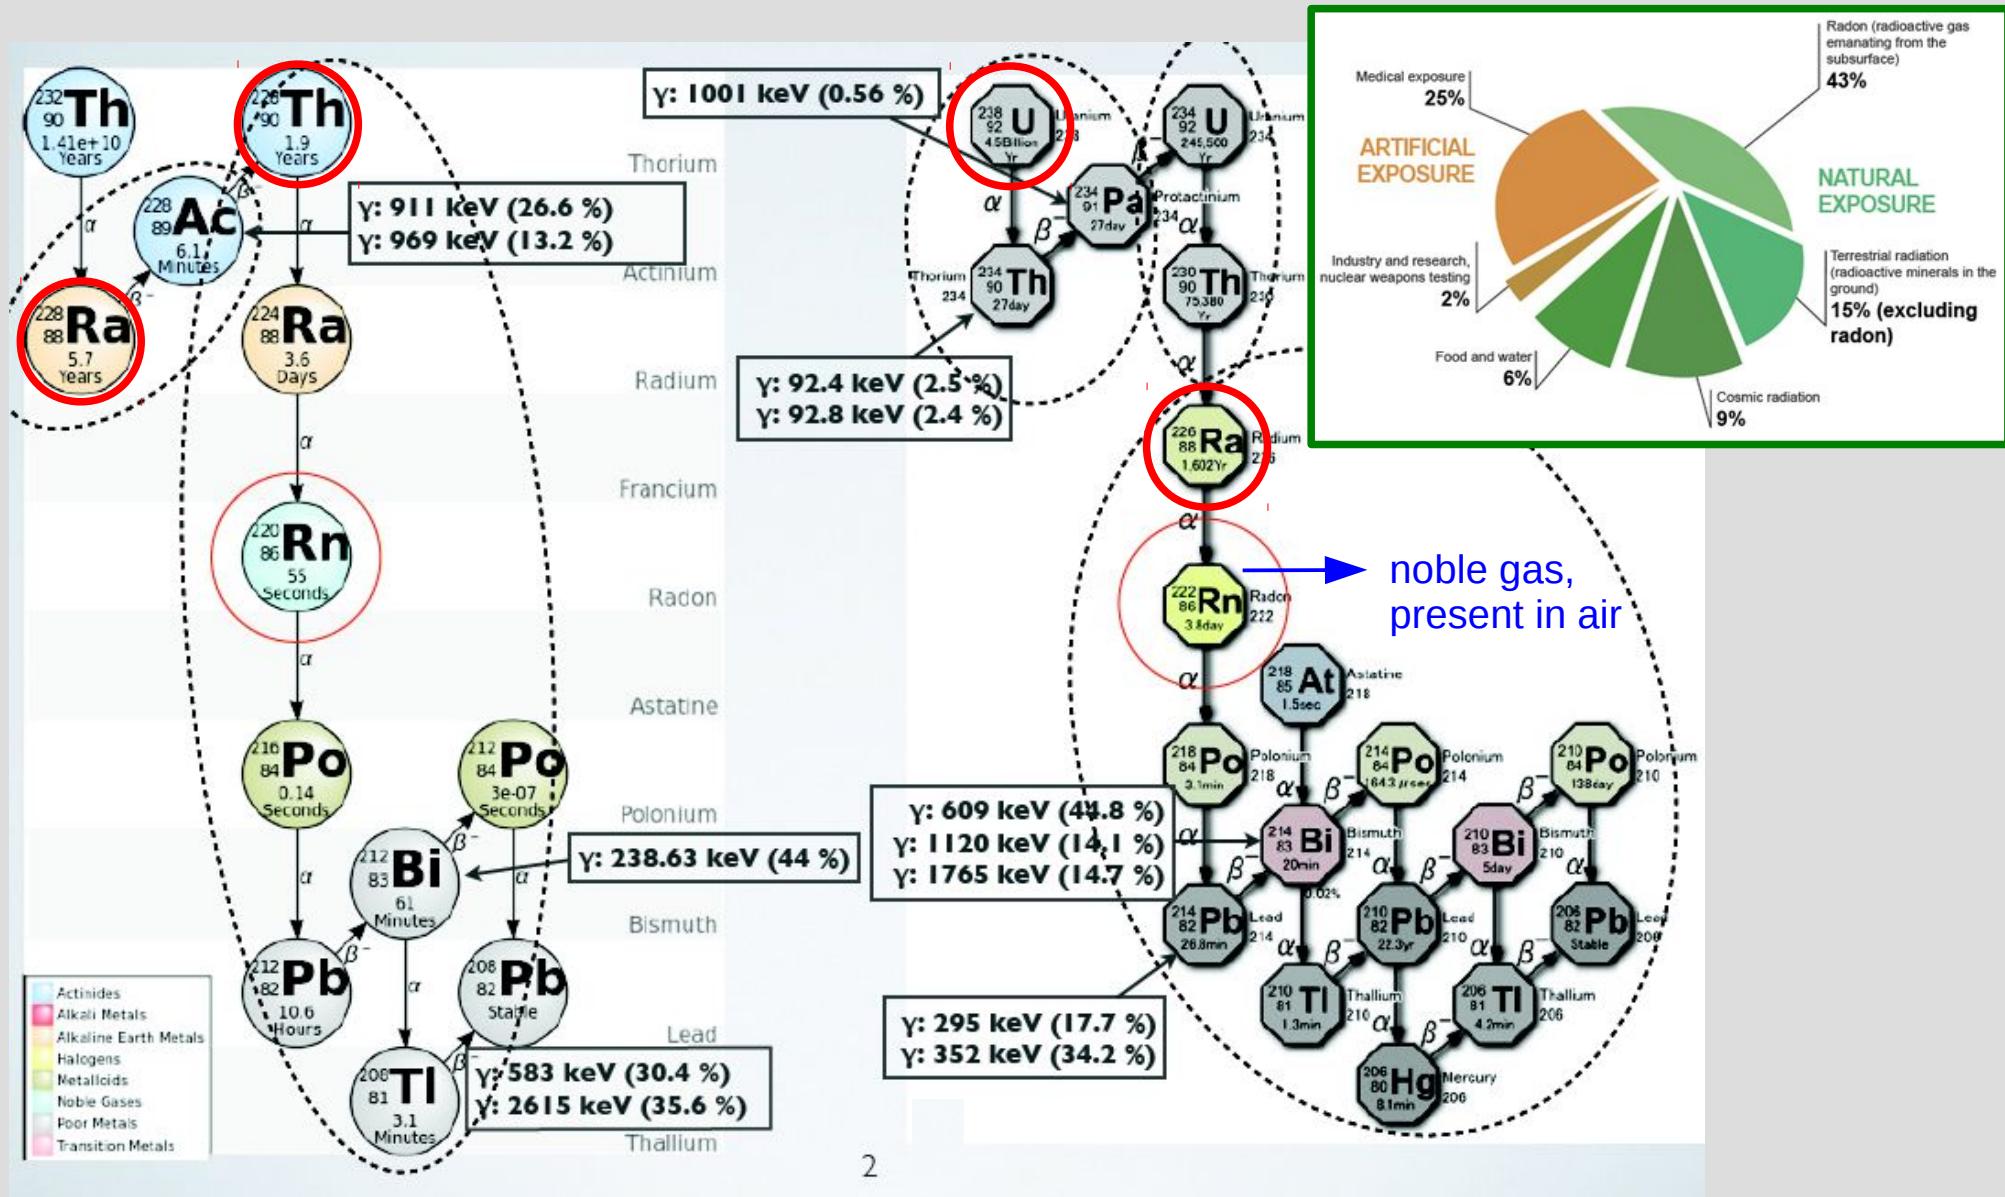

# Background Sources

# The U and Th Chains

ALBERT EINSTEIN CENTER  
FOR FUNDAMENTAL PHYSICS

# Low-background Screening

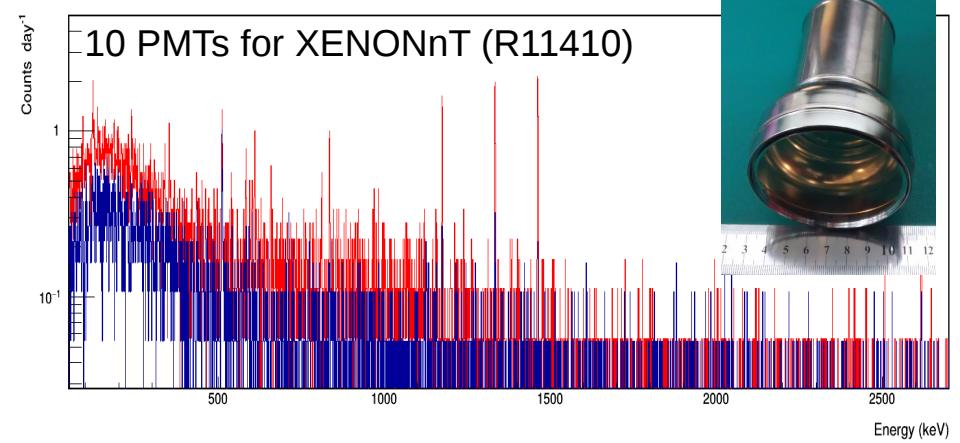

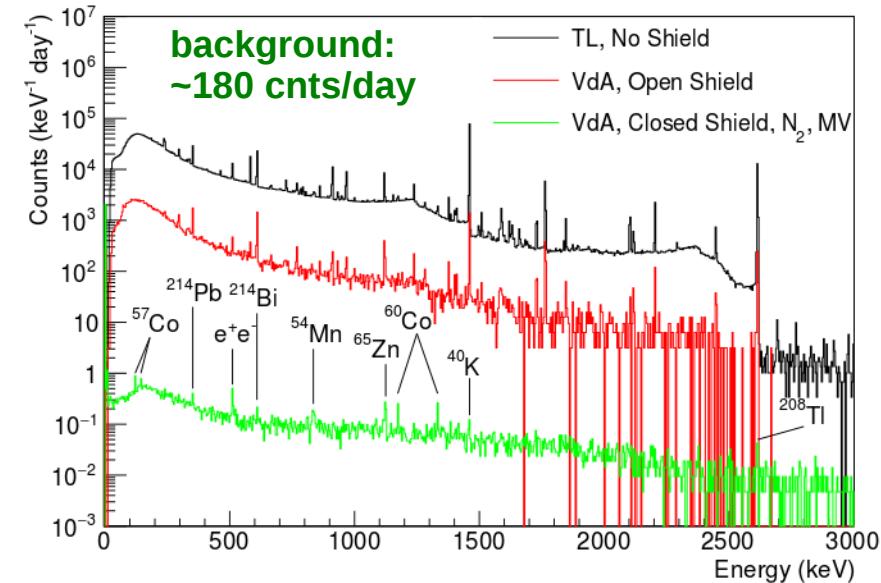

JINST 11, P12017 (2016)

Vue des Alpes Laboratory  
(600 mwe)

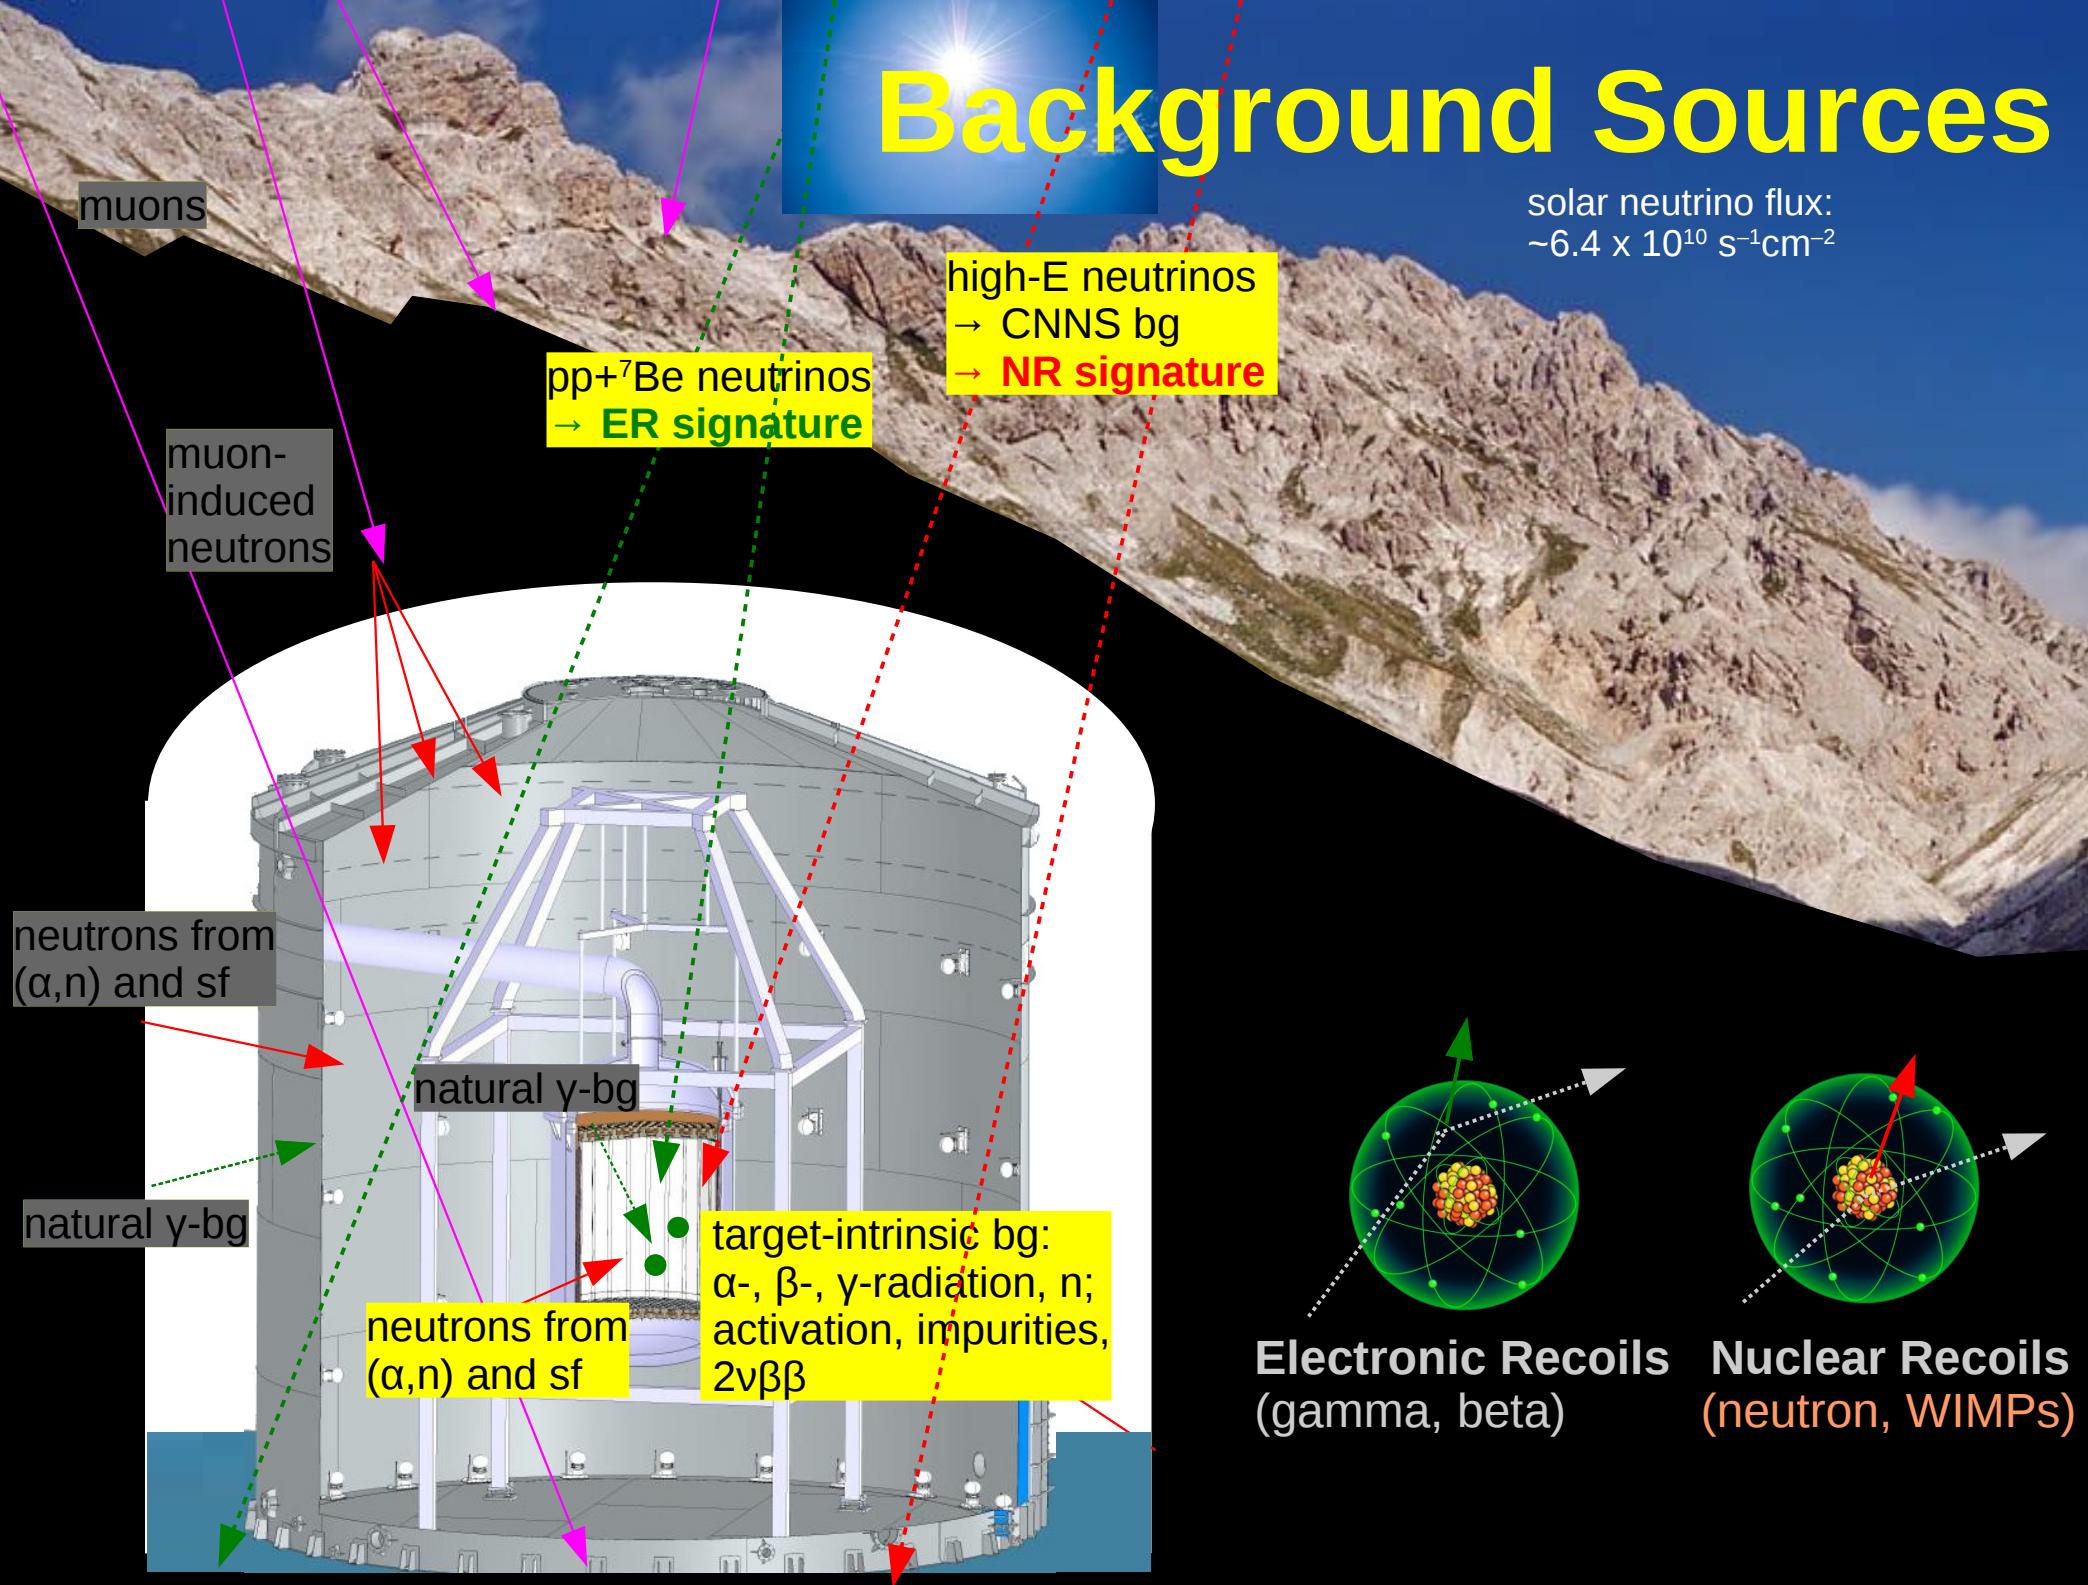

*Identify materials with lowest radioactivity:*

- $\gamma$ -spectrometry using HPGe Detectors
- mass spectroscopy: ICP-MS, GDMS
- neutron activation analysis
- $^{222}\text{Rn}$  emanation

# Background Sources

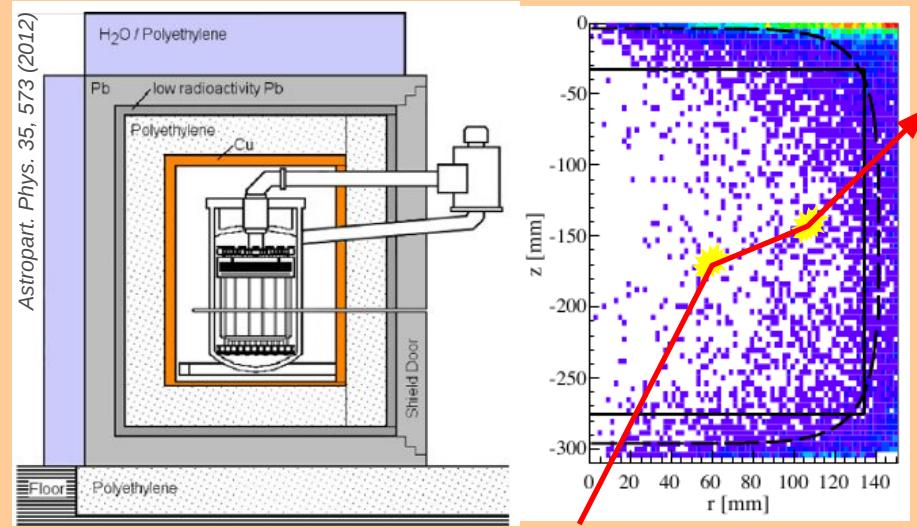

# Background Suppression

## Avoid Backgrounds

### Shielding

- deep underground location
- large shield (Pb, water, PE)
- active veto ( $\mu$ ,  $\gamma$  coincidence)
- self shielding  $\rightarrow$  fiducialization

### Use of radiopure materials

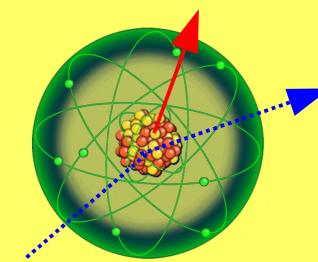

## Use knowledge about expected WIMP signal

### WIMPs interact only once

- $\rightarrow$  single scatter selection
- requires some position resolution

### WIMPs interact with target nuclei

- $\rightarrow$  nuclear recoils
- exploit different  $dE/dx$  from signal and background

# XENON1T @ www.gransassovideogame.it

the xenon-filled  
TPC is inside here

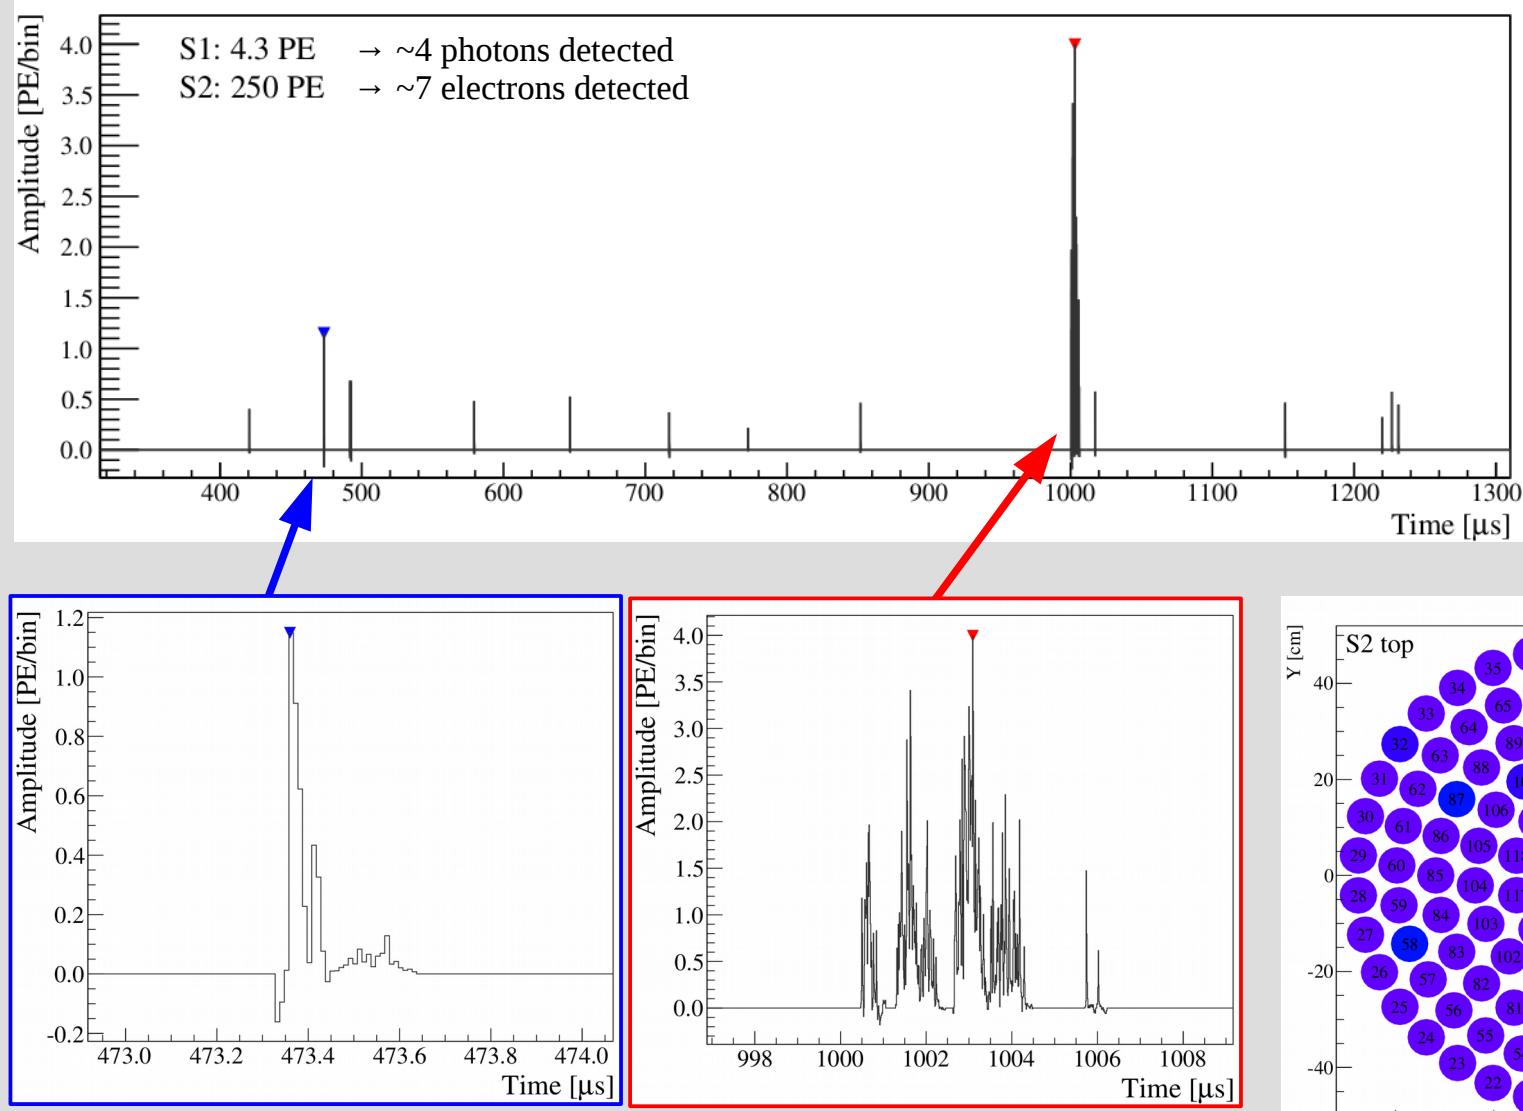

largest LXe TPC built so far...

cylinder: 96 cm

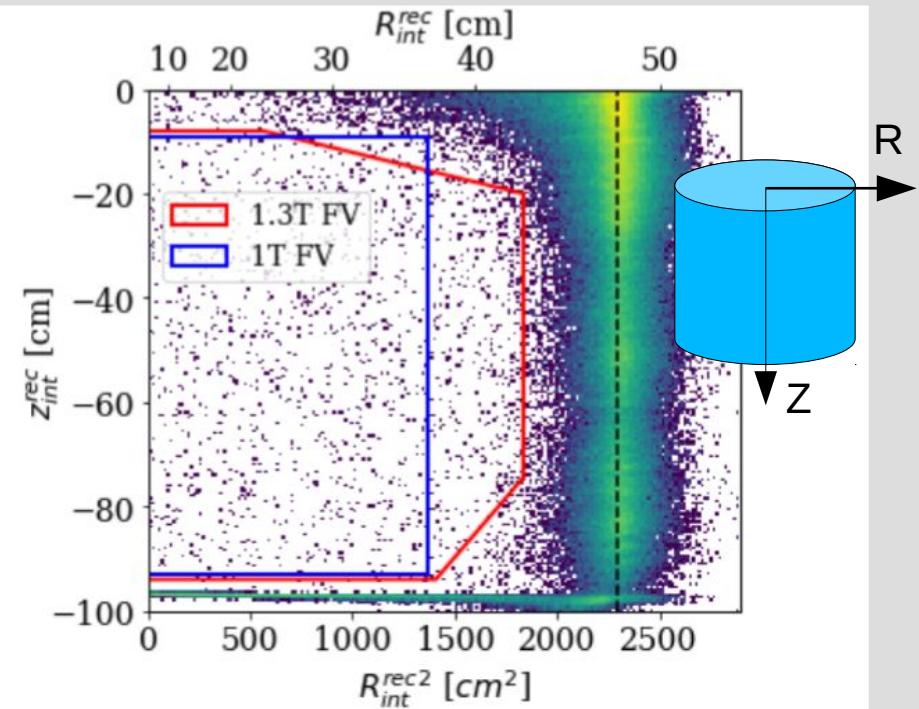

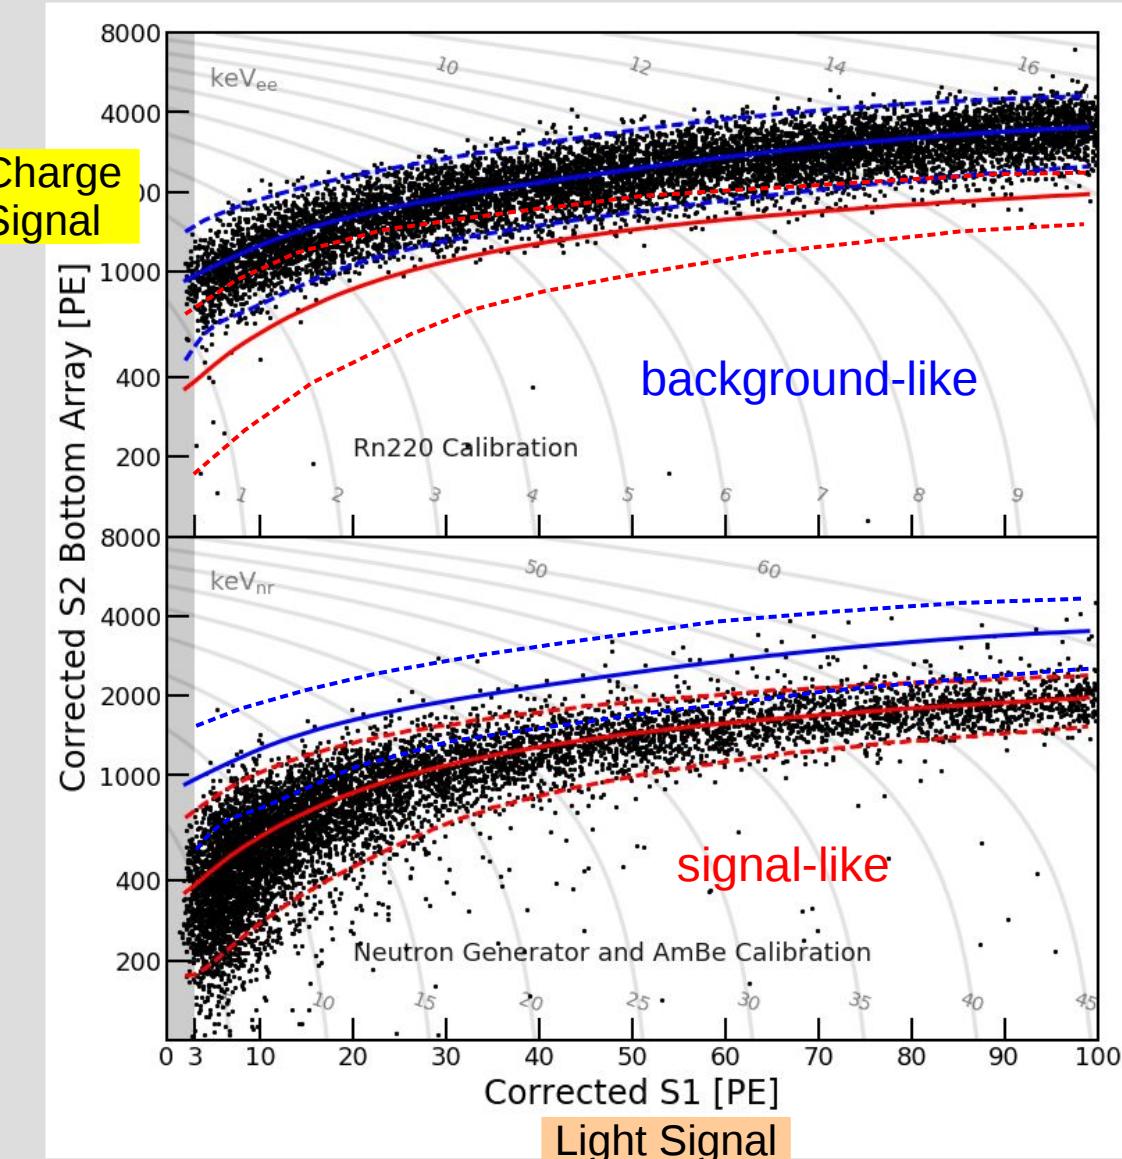

active LXe target: 2.0t (3.2t total)  
248 PMTs

# How would dark matter look?

... but it's a low-E neutron interaction from calibration!

# Calibration and Analysis

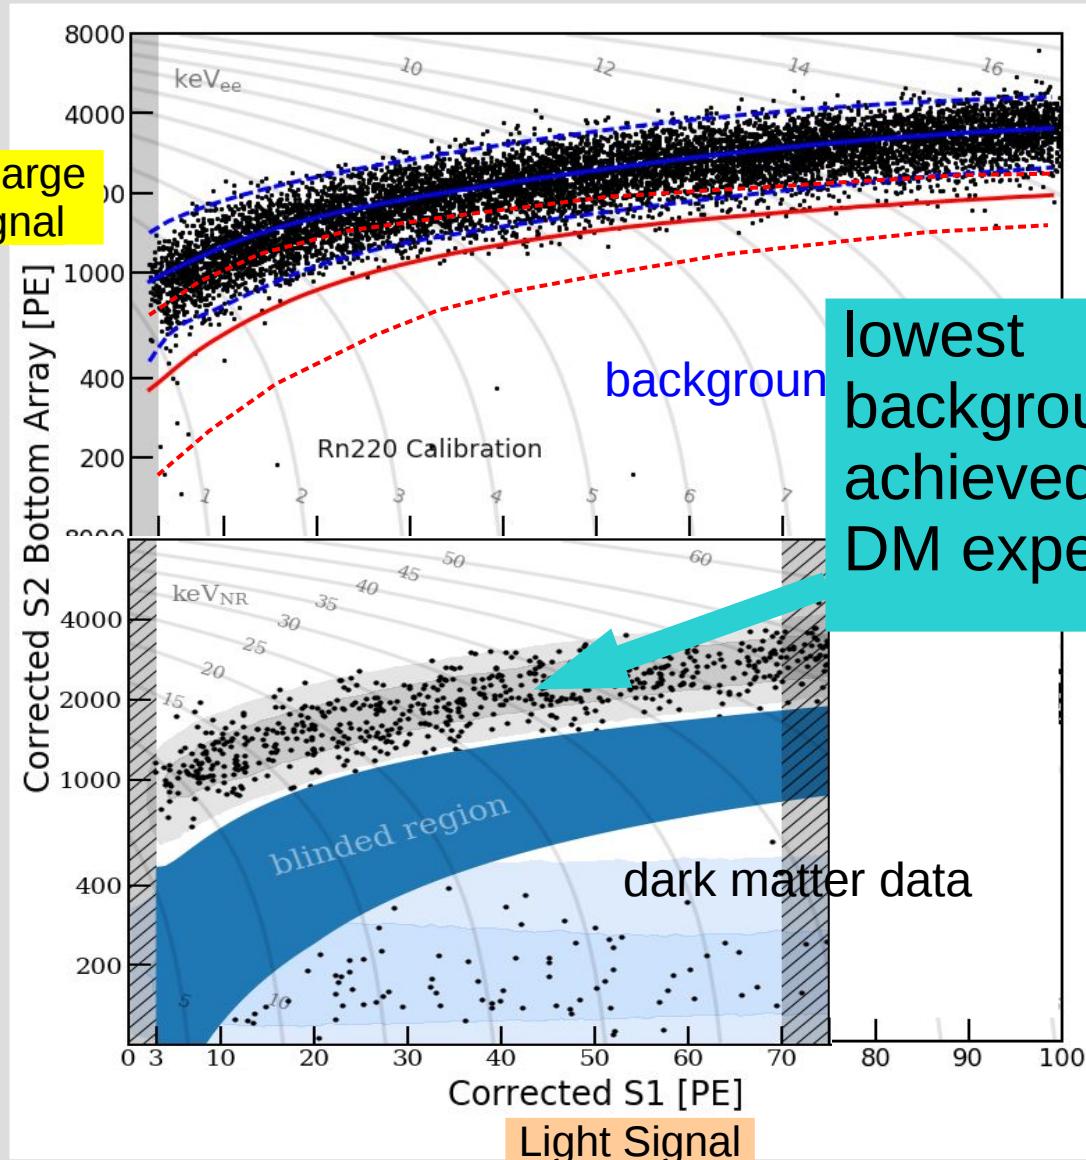

Used to construct **background** and **signal** models.

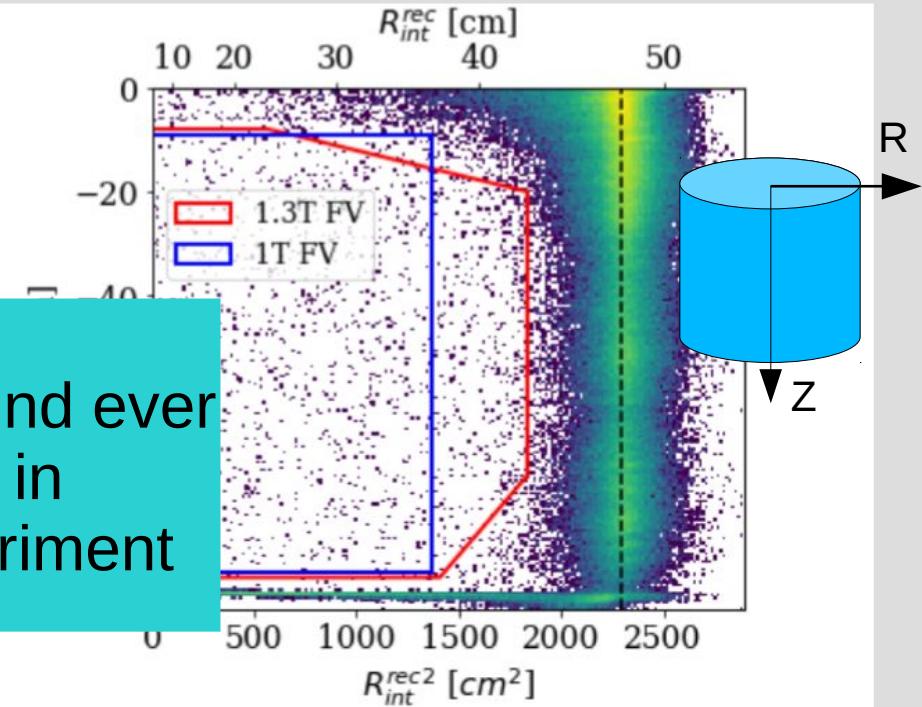

use **central 1.3 t** LXe for analysis

Exposure:  $1.3 \text{ t} \times 278.8 \text{ d} = 1.0 \text{ t} \times \text{y}$   
 → **largest low-bg exposure ever**

# Blind WIMP Search

lowest background ever achieved in DM experiment

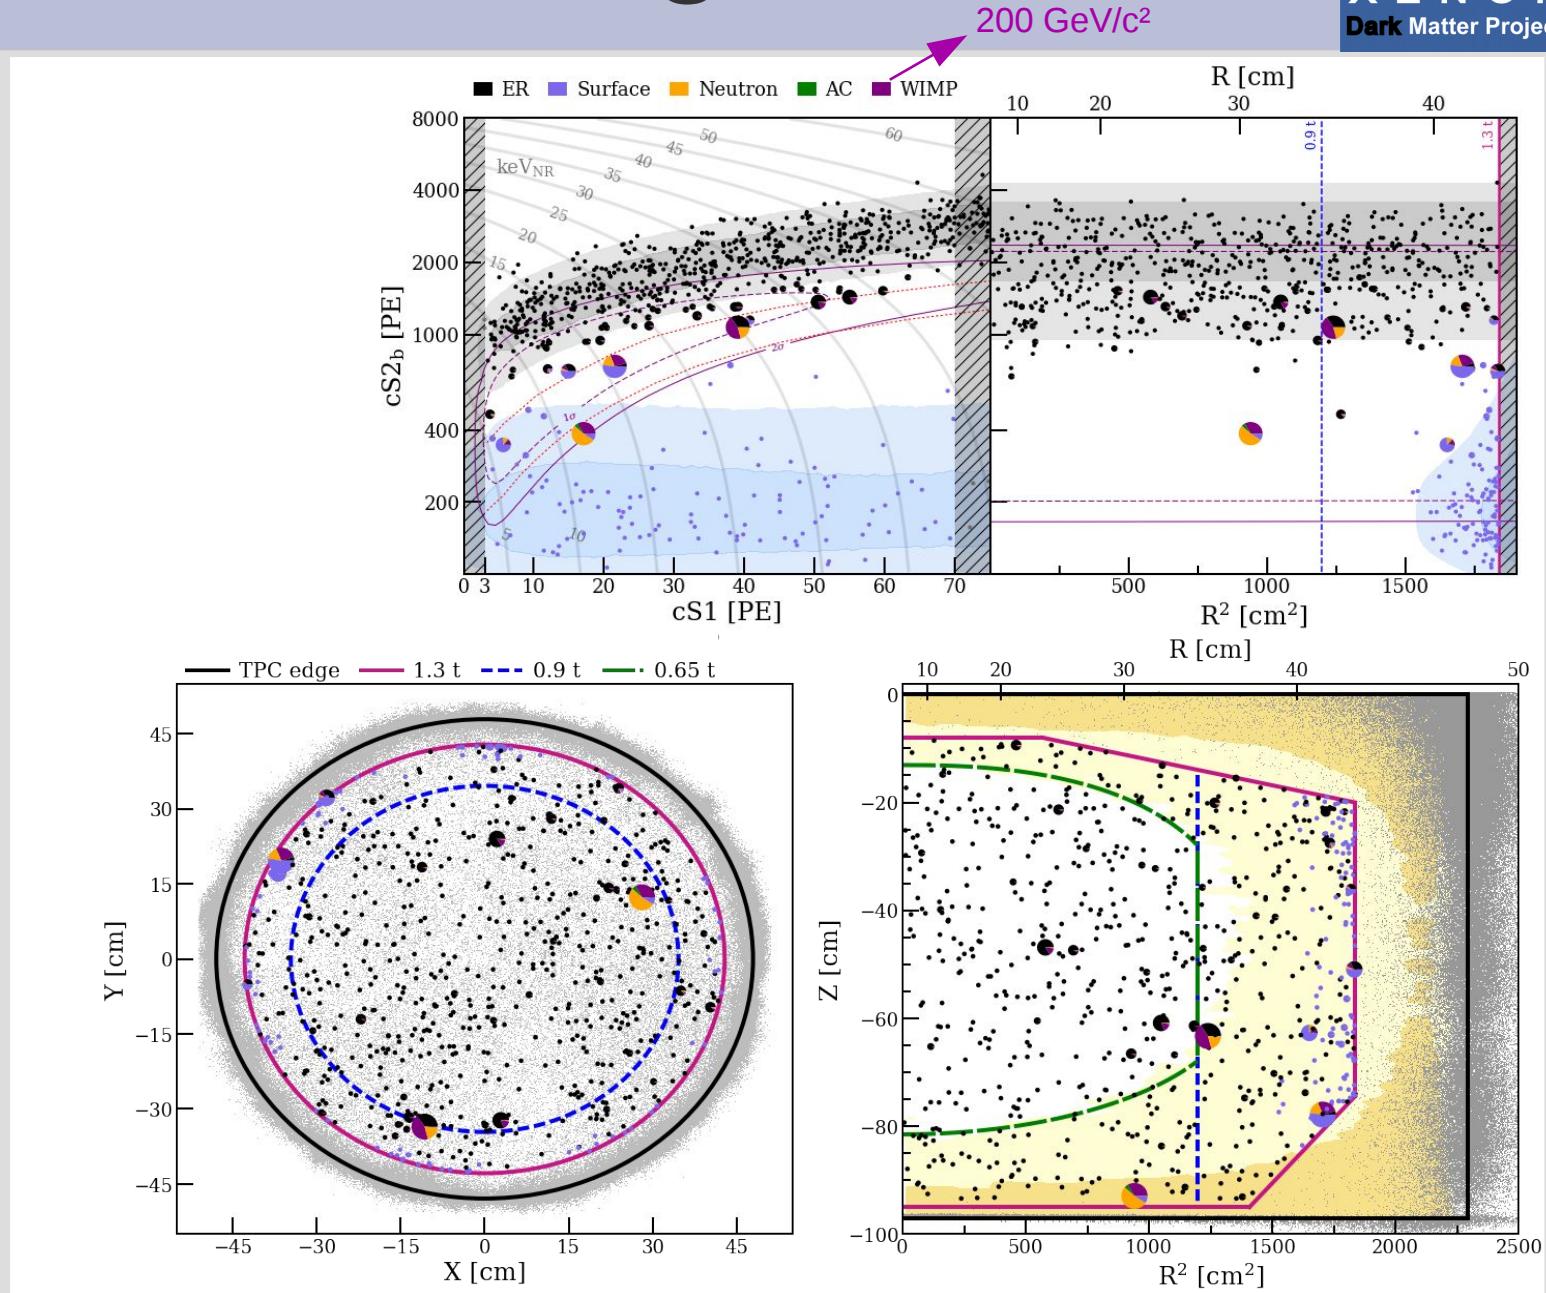

Used to construct **background** and **signal** models.

use **central 1.3 t** LXe for analysis

**Blind analysis**  
= region of interest inaccessible during analysis to avoid human bias

# Unblinding

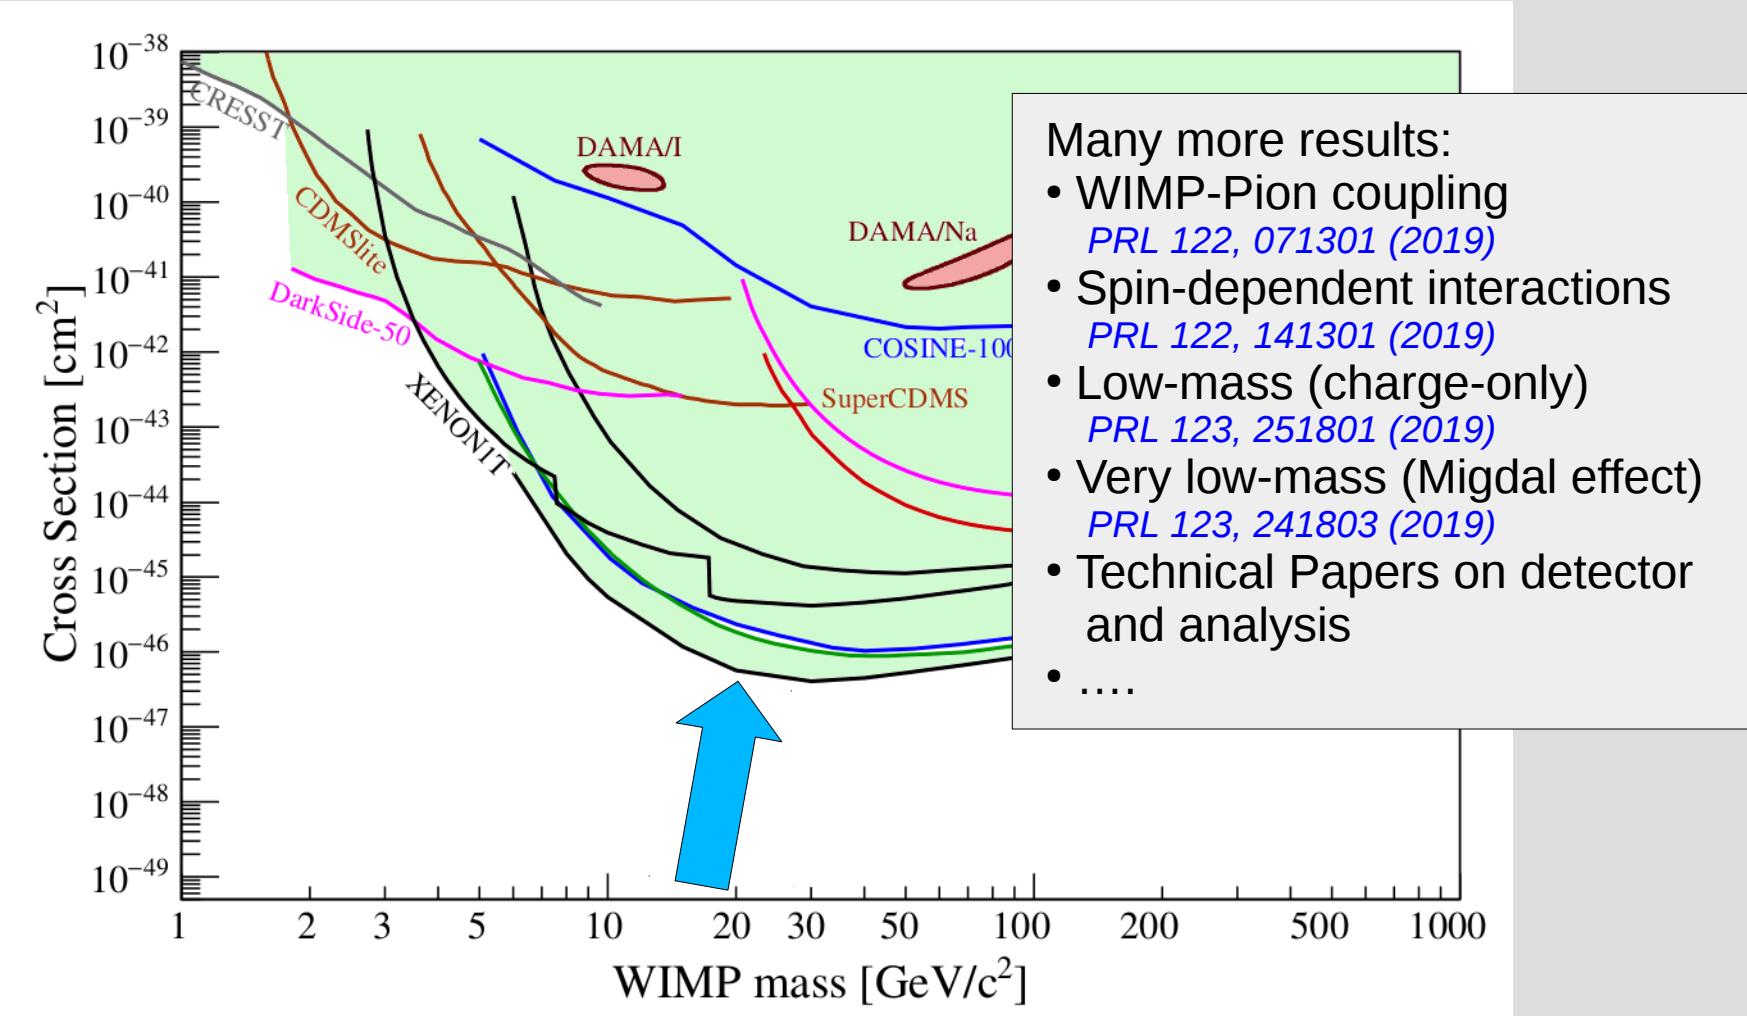

→ no statistically significant excess observed

# No Signal → Exclusion Limit

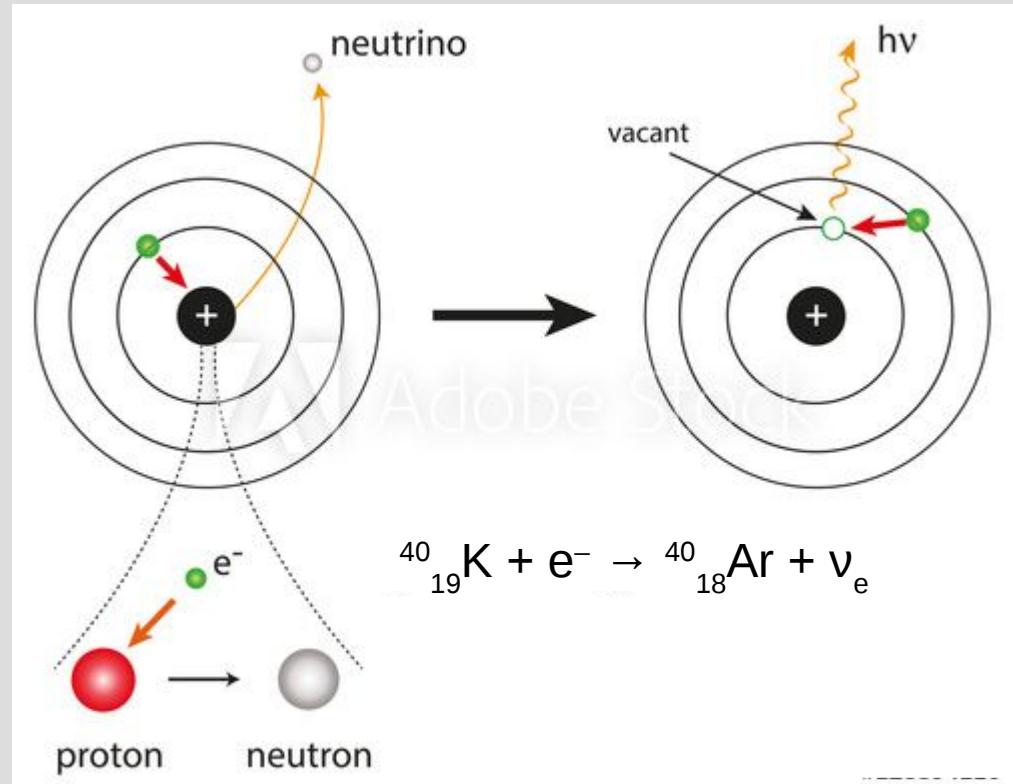

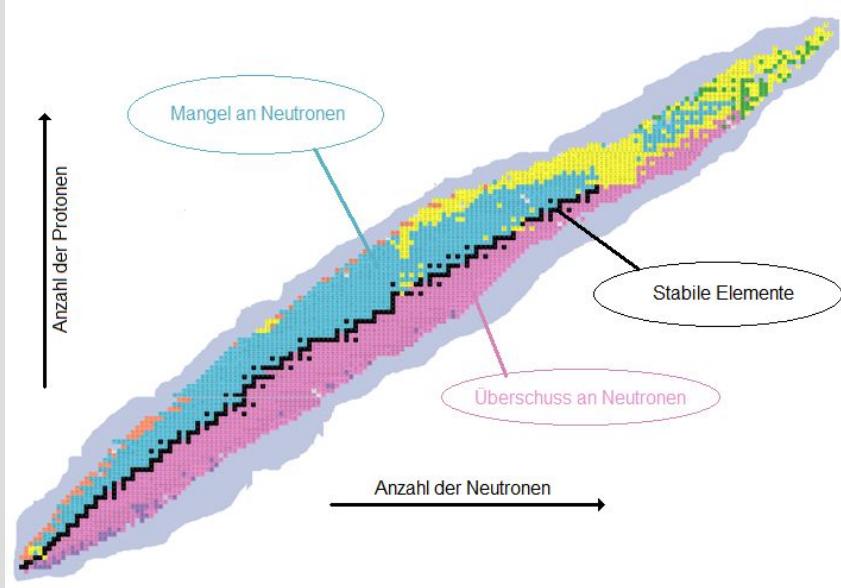

PRL 121, 111302 (2018)

Xe  
XENON  
Dark Matter Project

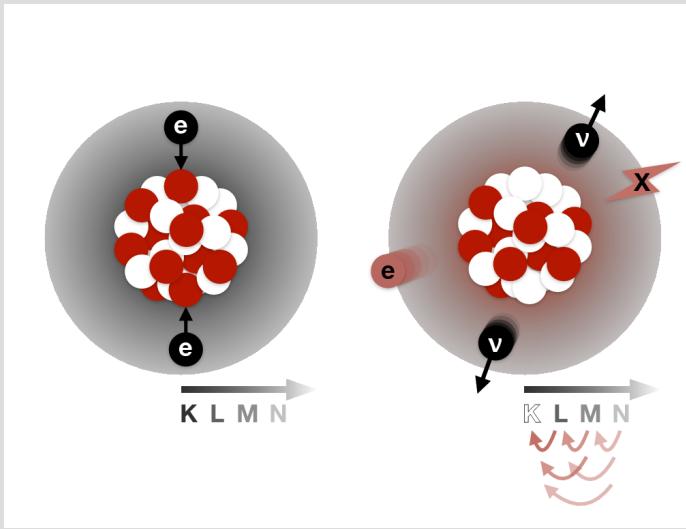

# Electron Capture (EC)

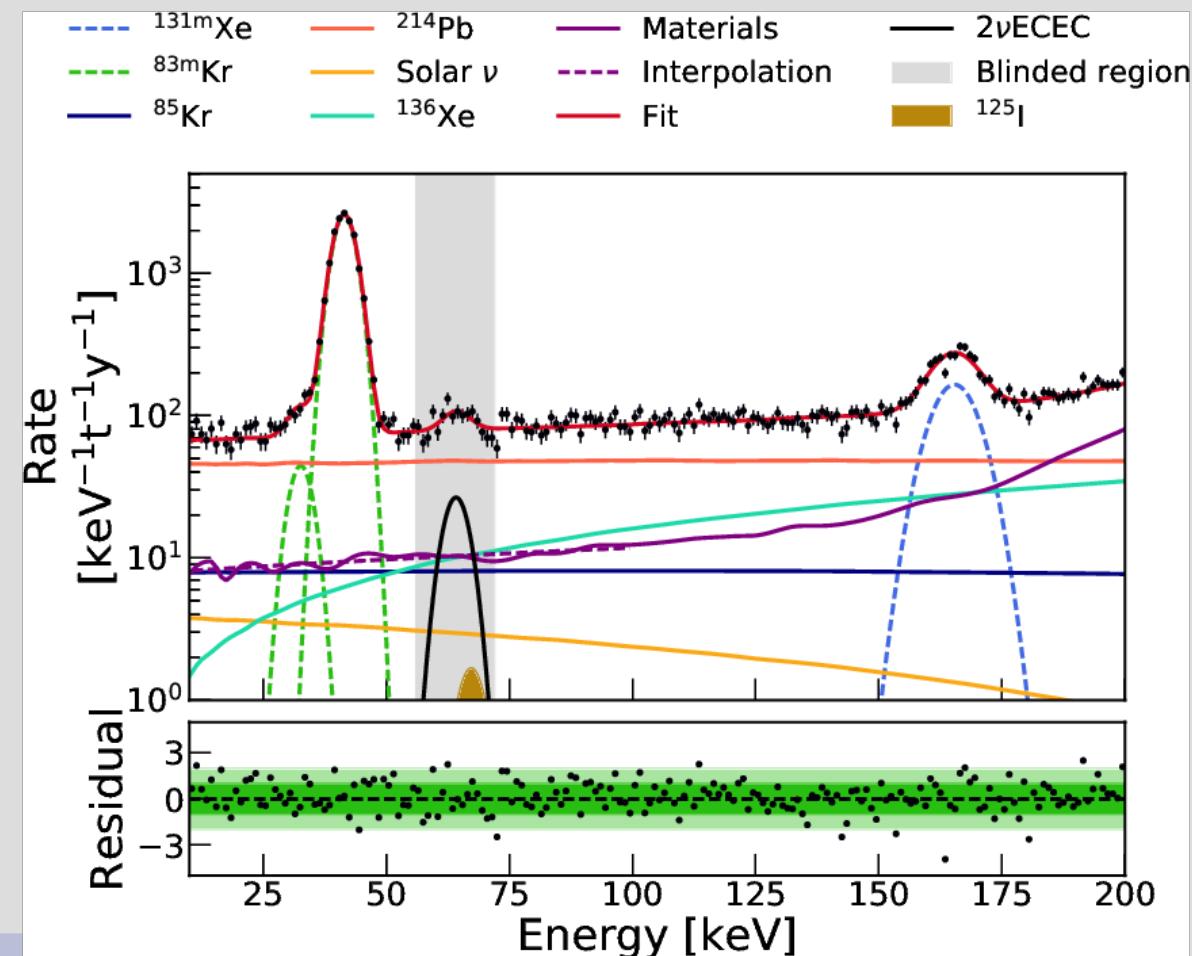

Competing process to  $\beta^+$  decay

# Double Electron Capture of $^{124}\text{Xe}$

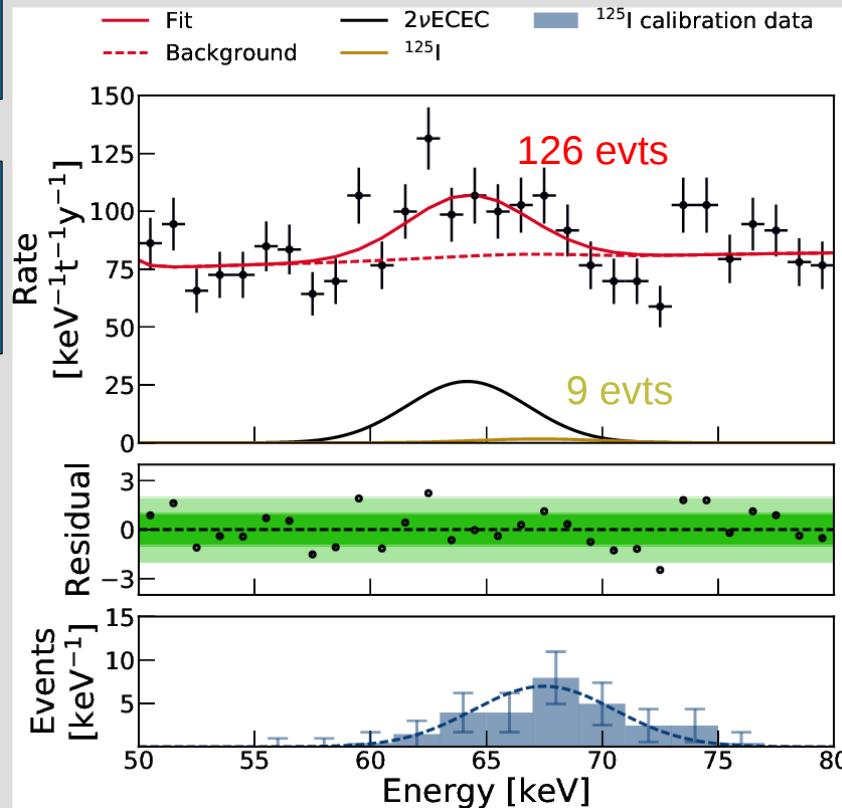

- 2nd order weak process with very long half life  $T_{1/2}$
  - so far observed in  $^{78}\text{Kr}$ ,  $^{130}\text{Ba}$
  - $^{124}\text{Xe} + 2 e^- \rightarrow {}^{124}\text{Te}^{**} + 2 \nu_e$
- mono-energetic line at 64.33 keV

${}^{\text{nat}}\text{Xe}$  contains  $\sim 1 \text{ kg } {}^{124}\text{Xe}$  per ton

# Double Electron Capture of $^{124}\text{Xe}$

Nature 568, 532 (2019)

- 126 Events above Background in 1.5 t xenon
- $T_{1/2}^{2\nu\text{ECEC}} = (1.8 \pm 0.5_{\text{stat}} \pm 0.1_{\text{sys}}) \times 10^{22} \text{y}$
- **longest half life ever measured directly**

# XENON1T → XENONnT

JCAP 04, 027 (2016)

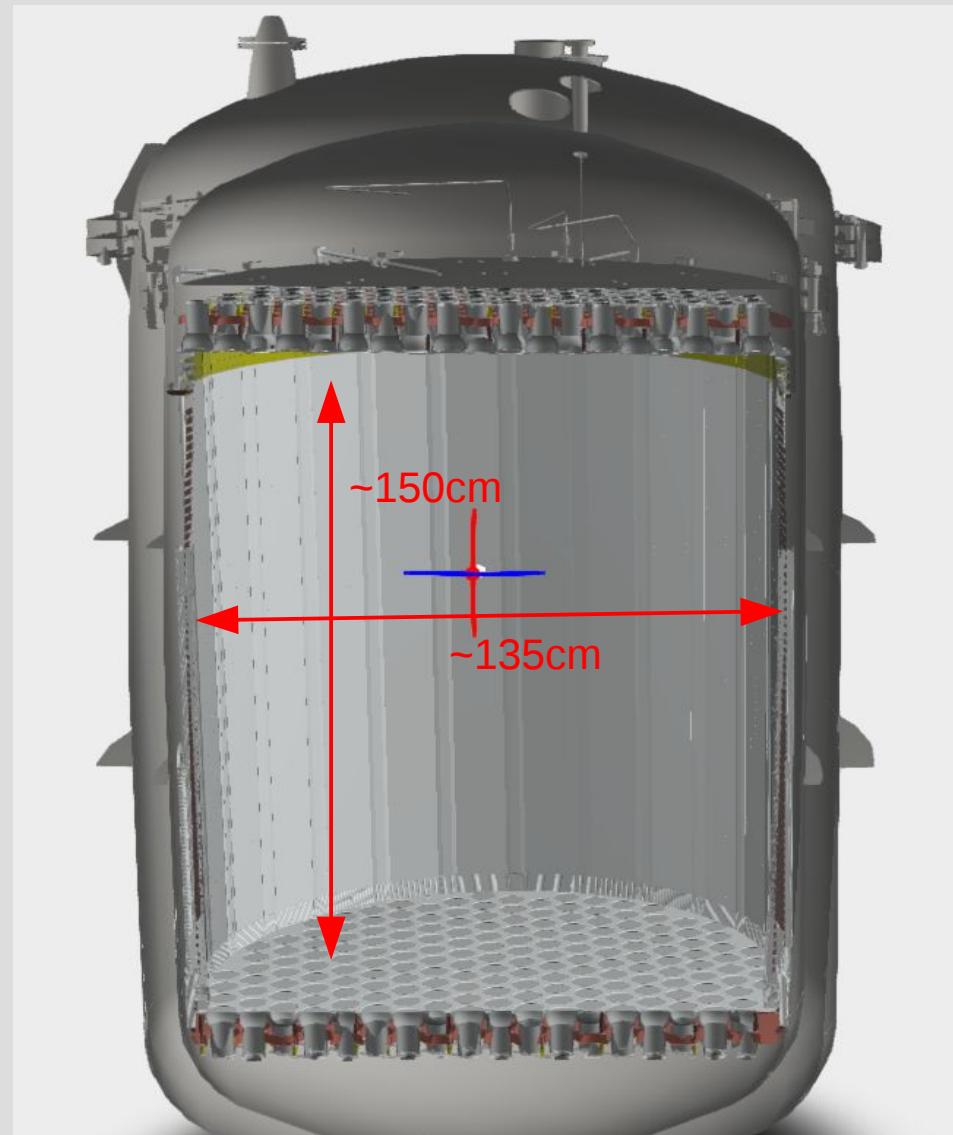

## XENON1T

- 2t active LXe target
- stopped Dec 2018

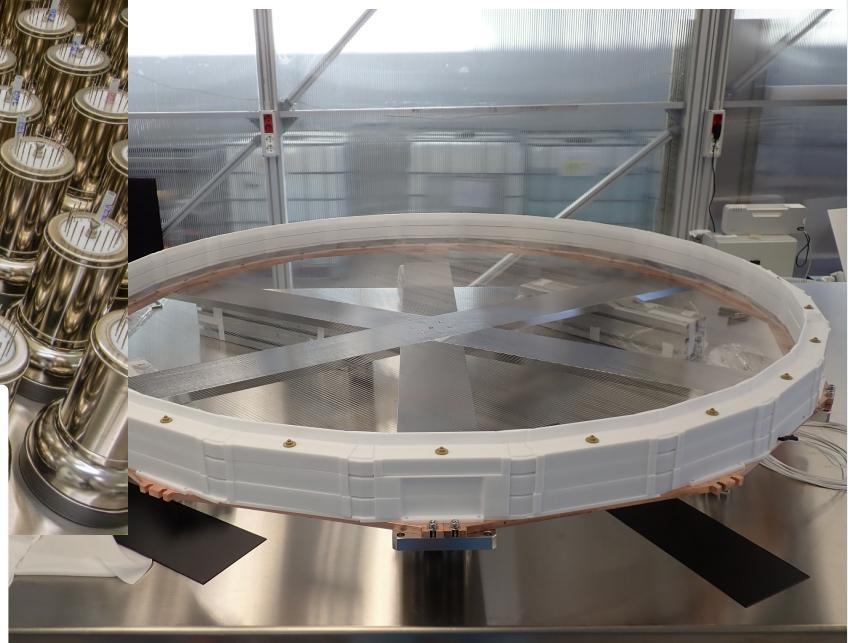

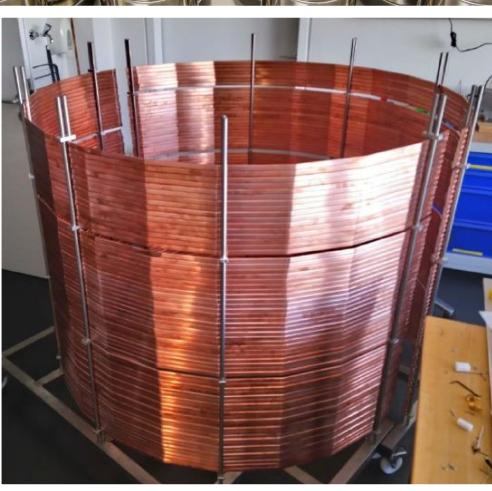

## XENONnT

- 5.9t active target
- science run by 2020

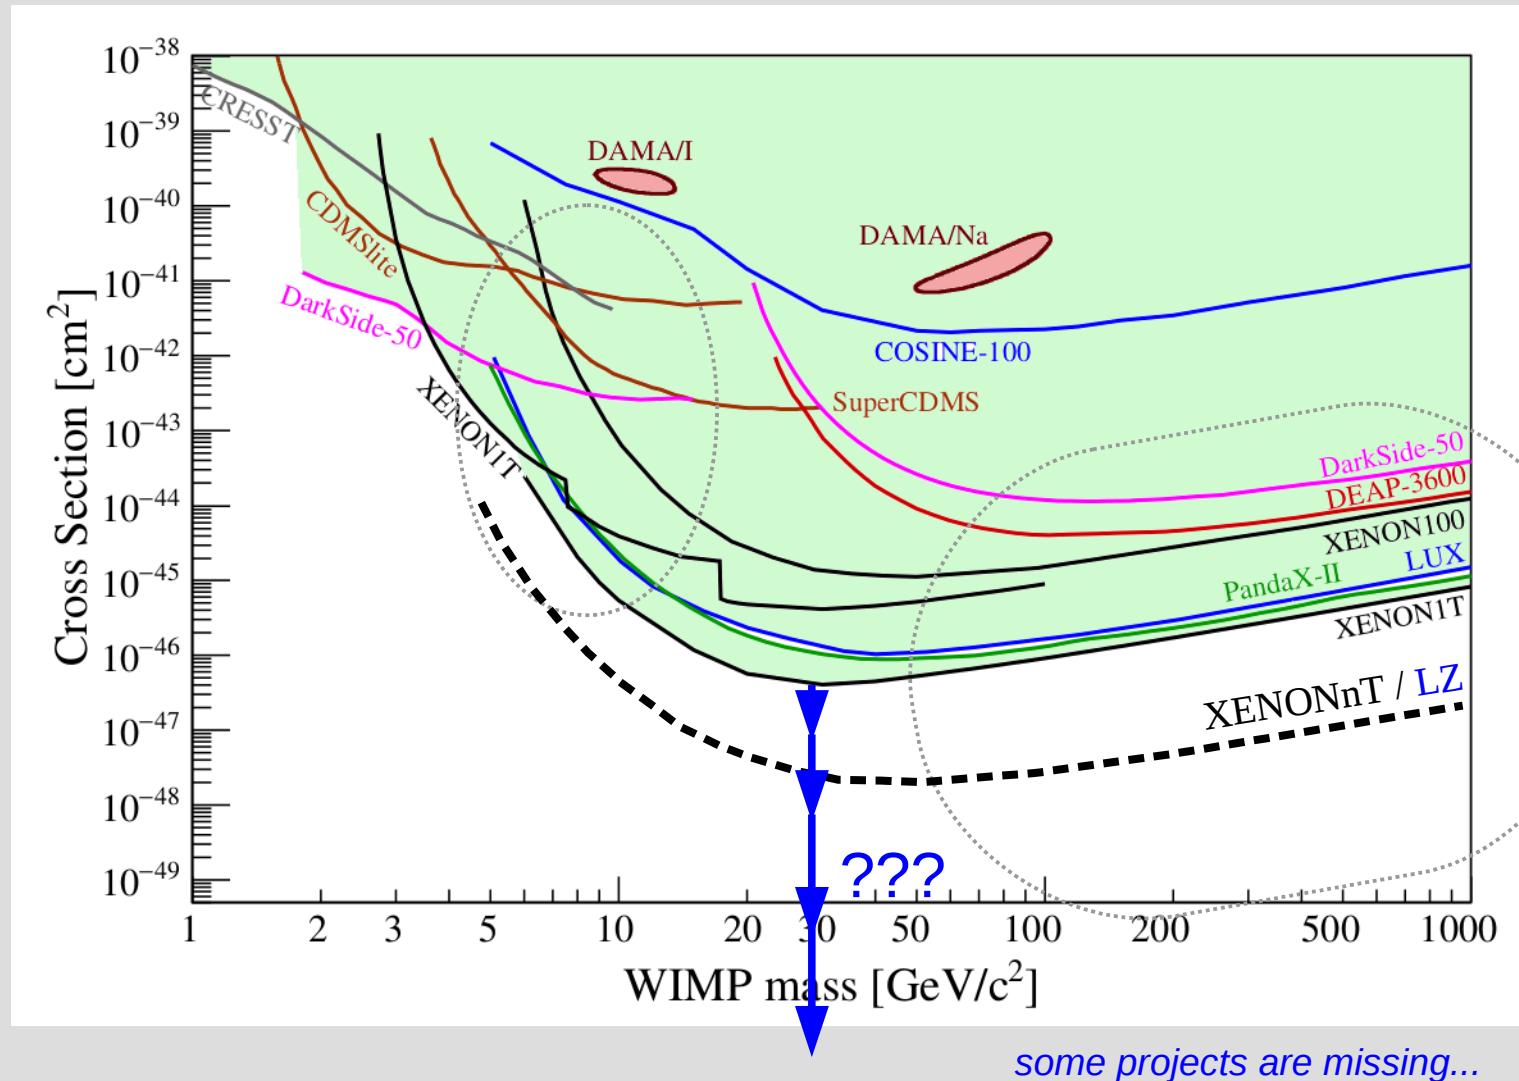

# XENONnT: under construction...

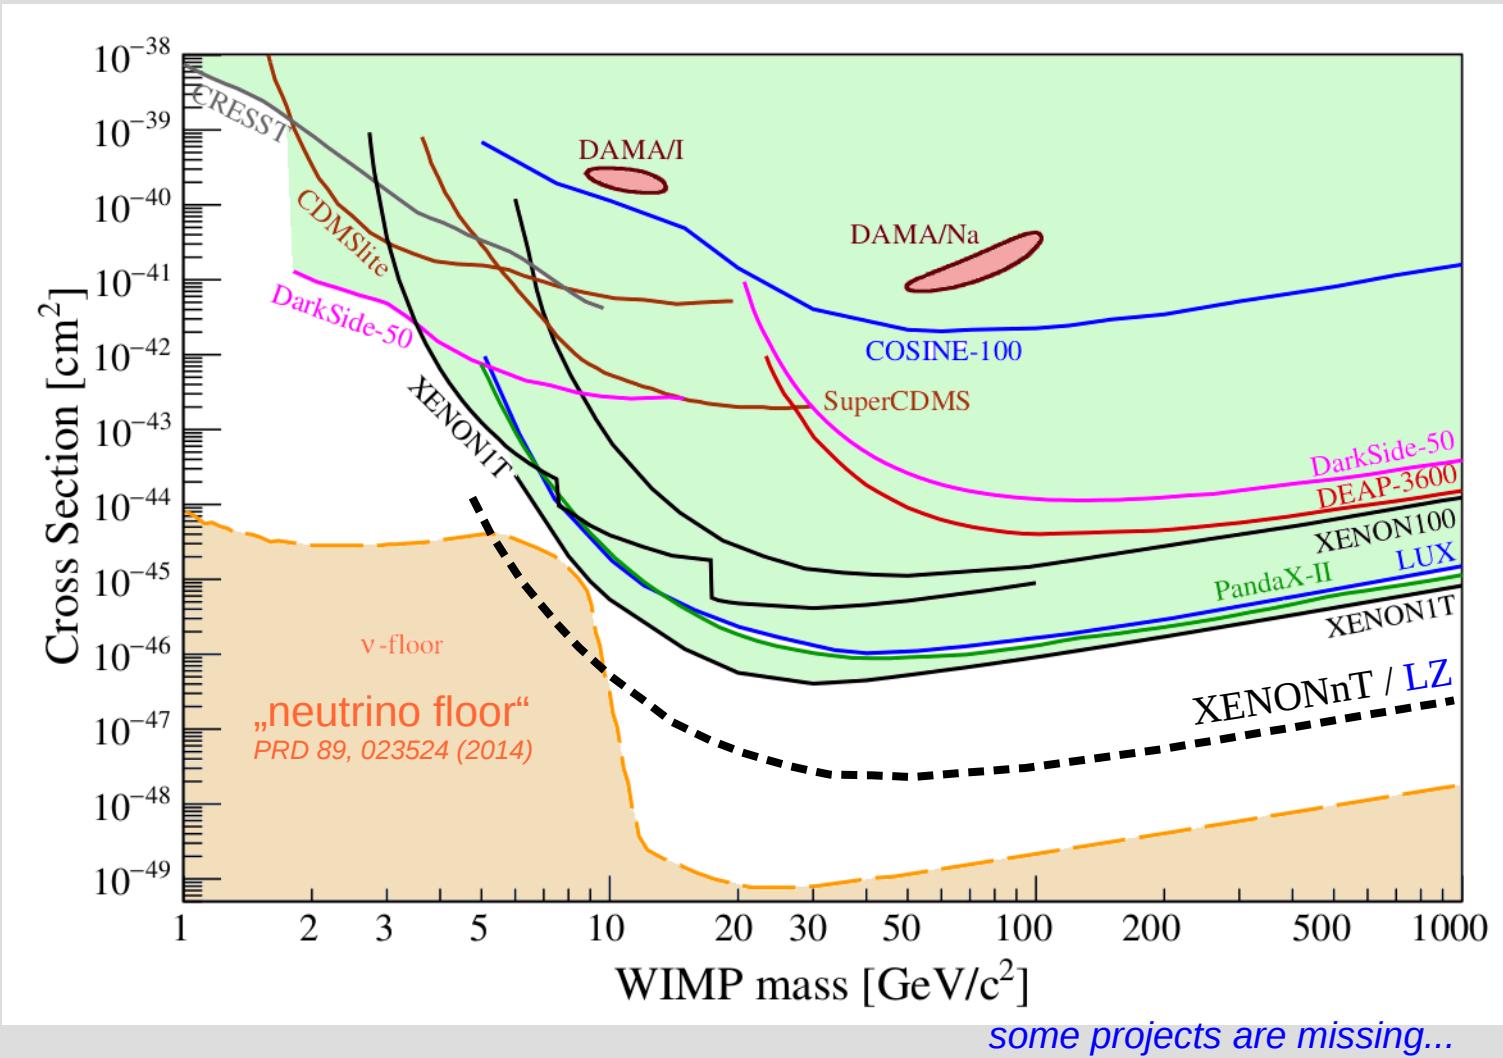

# XENON: The Future

spin-independent WIMP-nucleon interactions

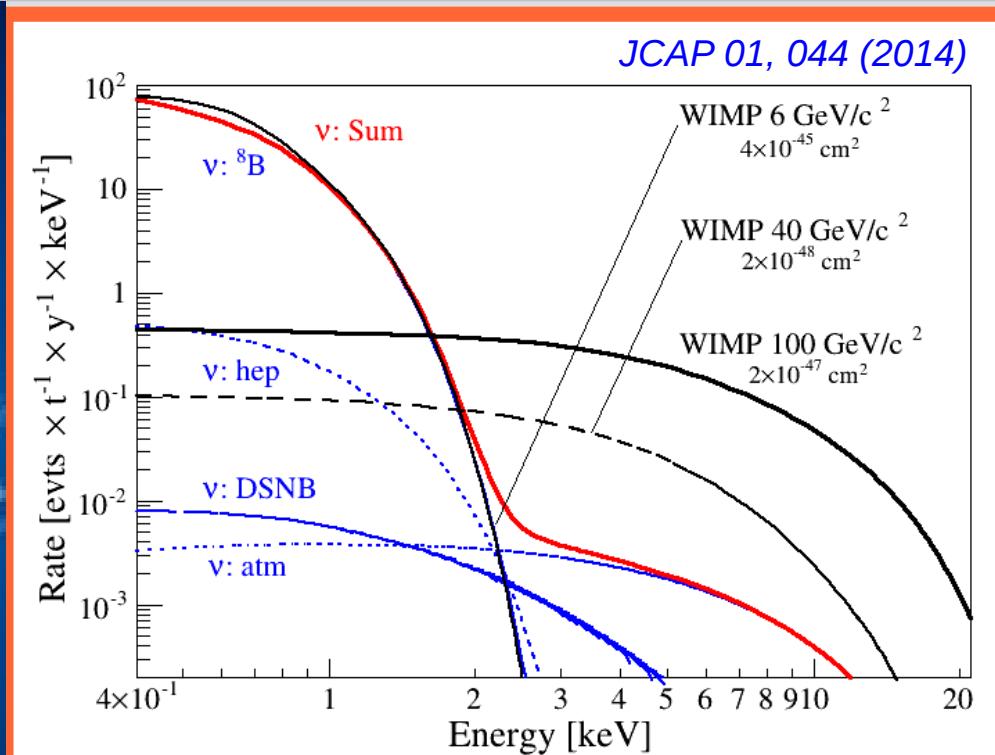

# Dark Matter Searches: The Limit

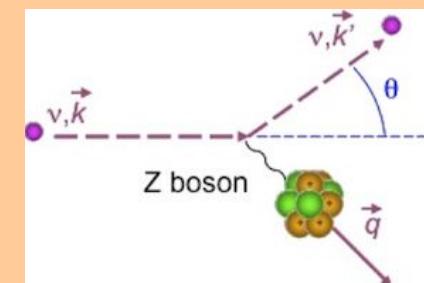

spin-independent WIMP-nucleon interactions

# Dark Matter Searches: The Limit

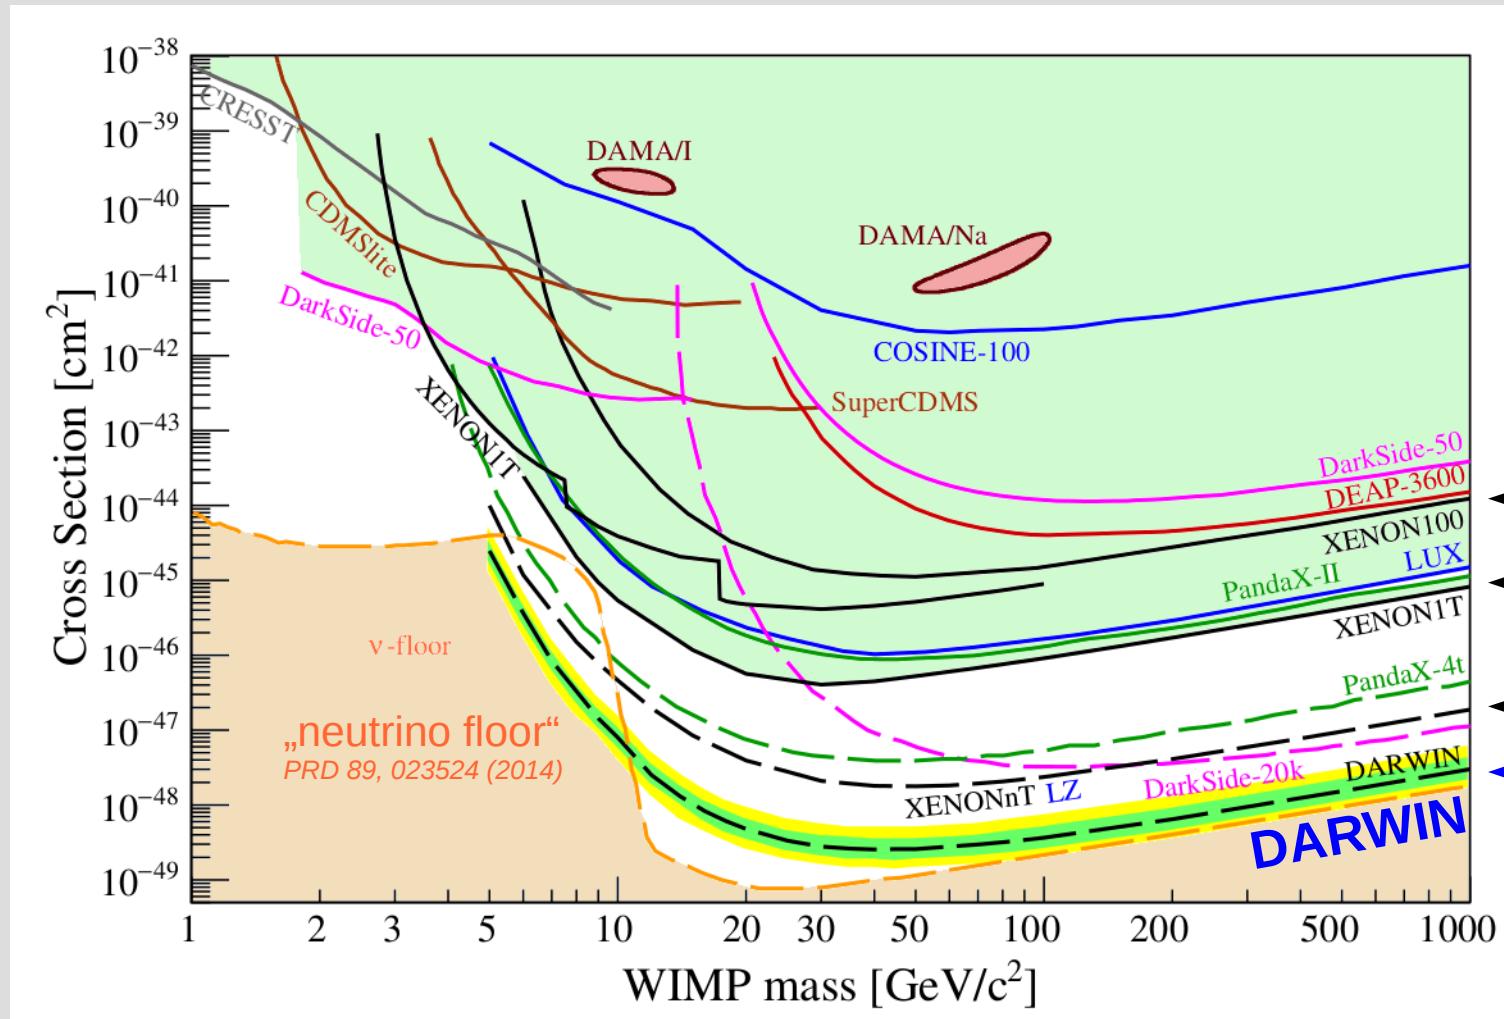

Interactions from coherent neutrino-nucleus scattering (CNNS) will dominate  
→ **ultimate background** for direct detection

# DARWIN The ultimative WIMP Detector

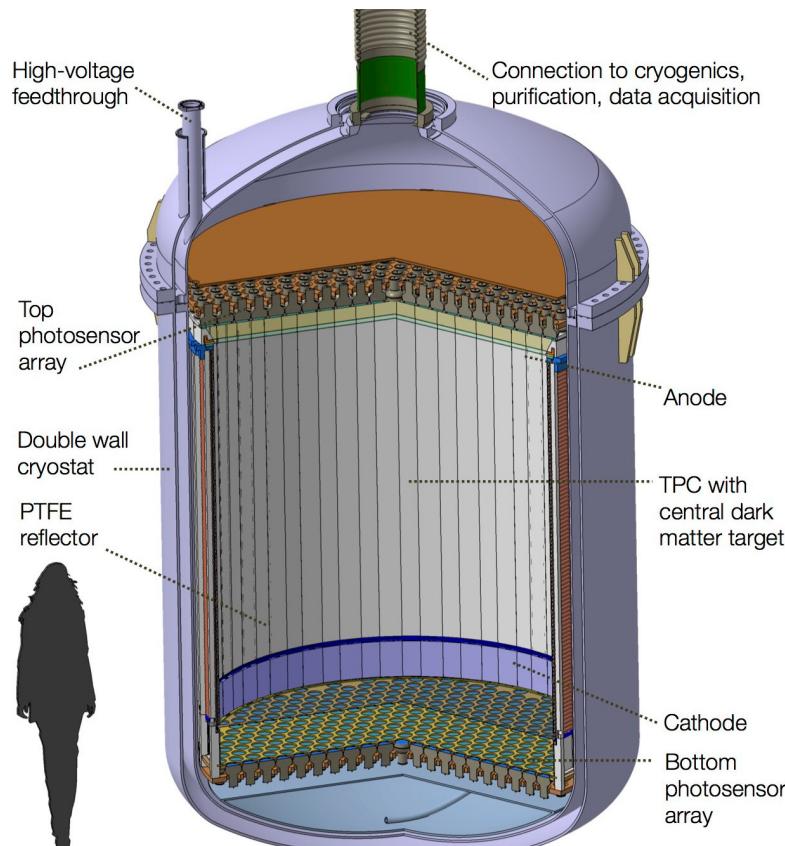

spin-independent WIMP-nucleon interactions

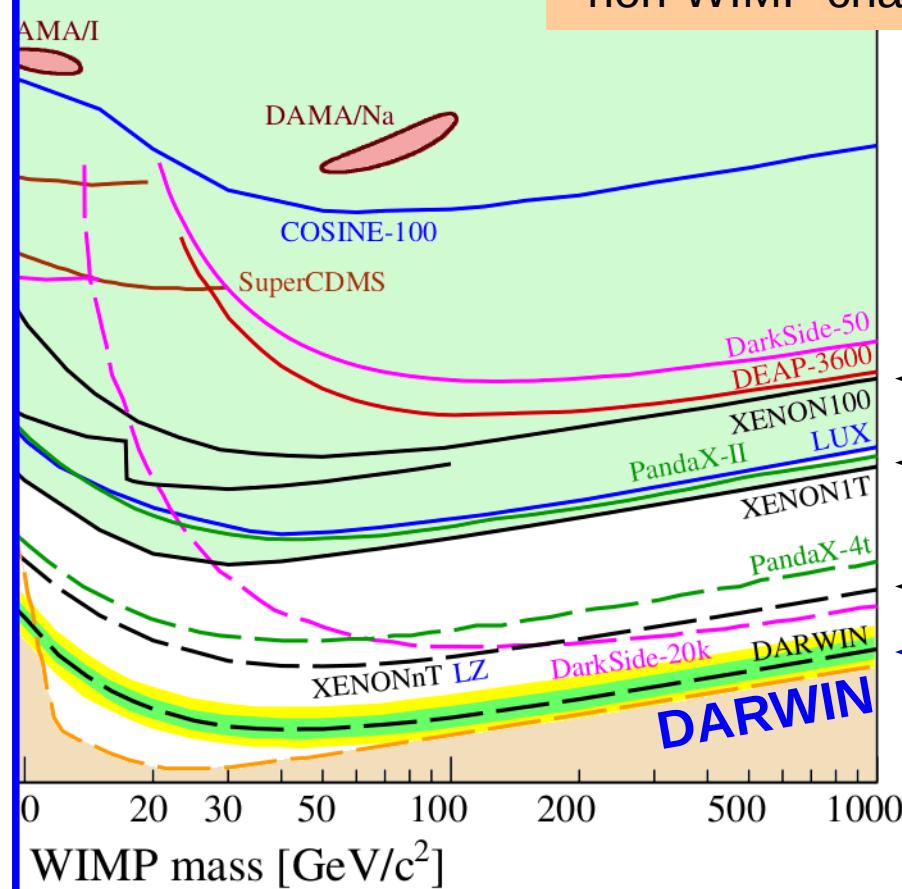

# DARWIN The ultimative WIMP Detector

**Baseline scenario**  
~50t total LXe mass  
**~40 t LXe TPC**  
~30 t fiducial mass

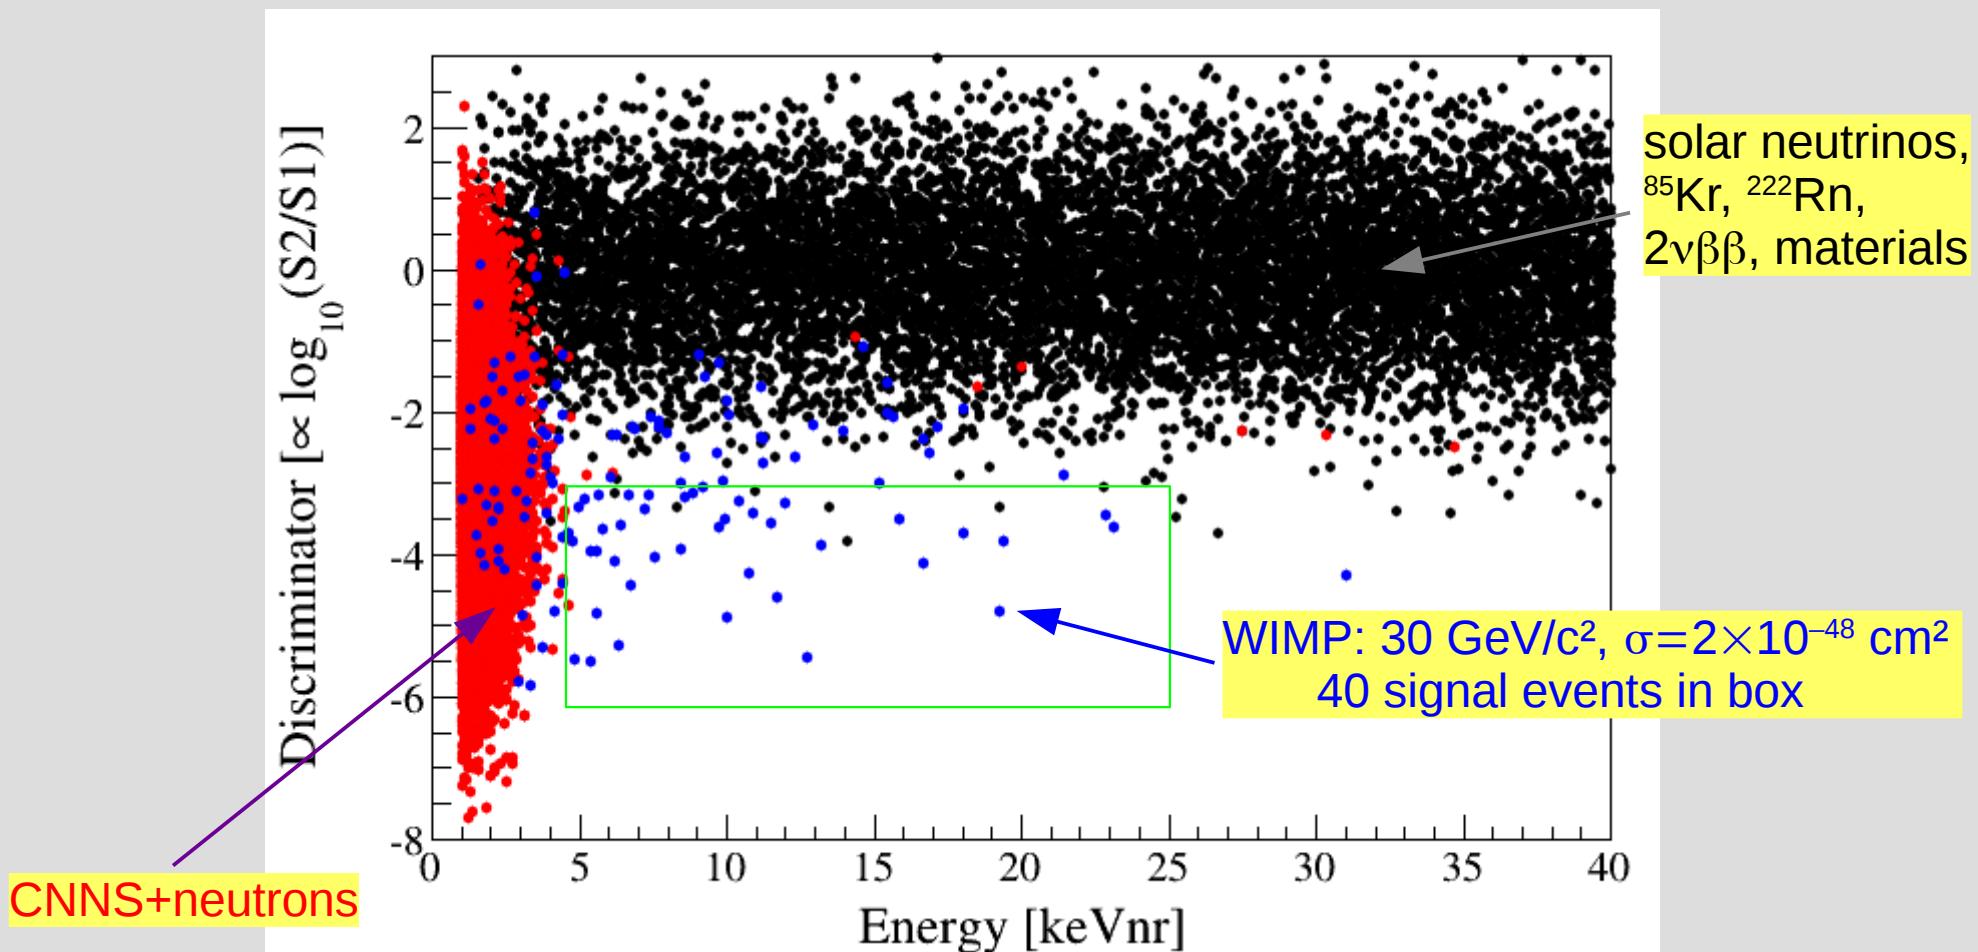

spin-independent WIMP-nucleon interactions

+many other WIMP and non-WIMP channels!

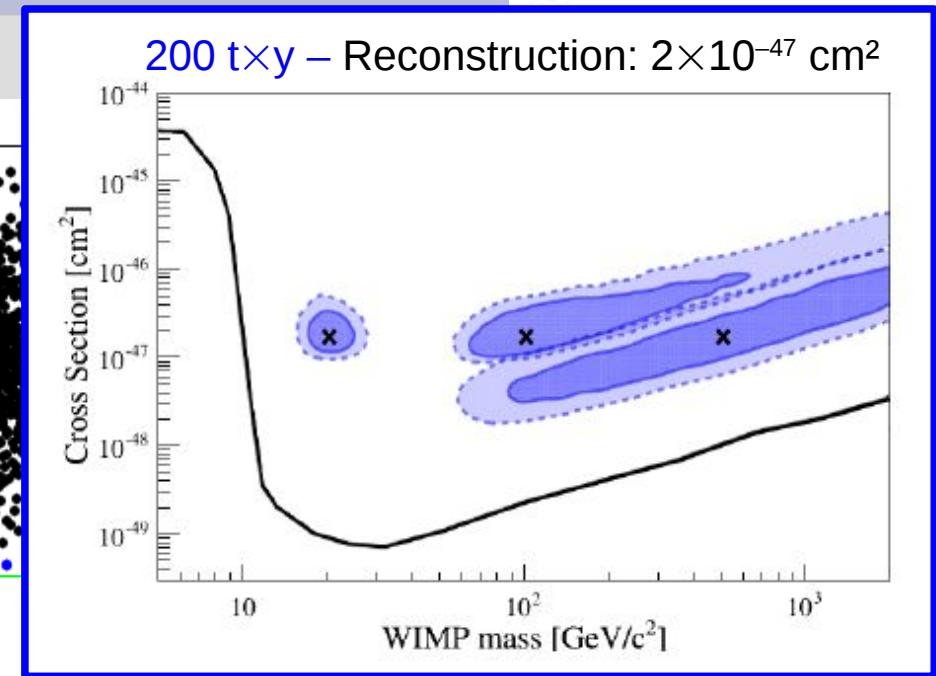

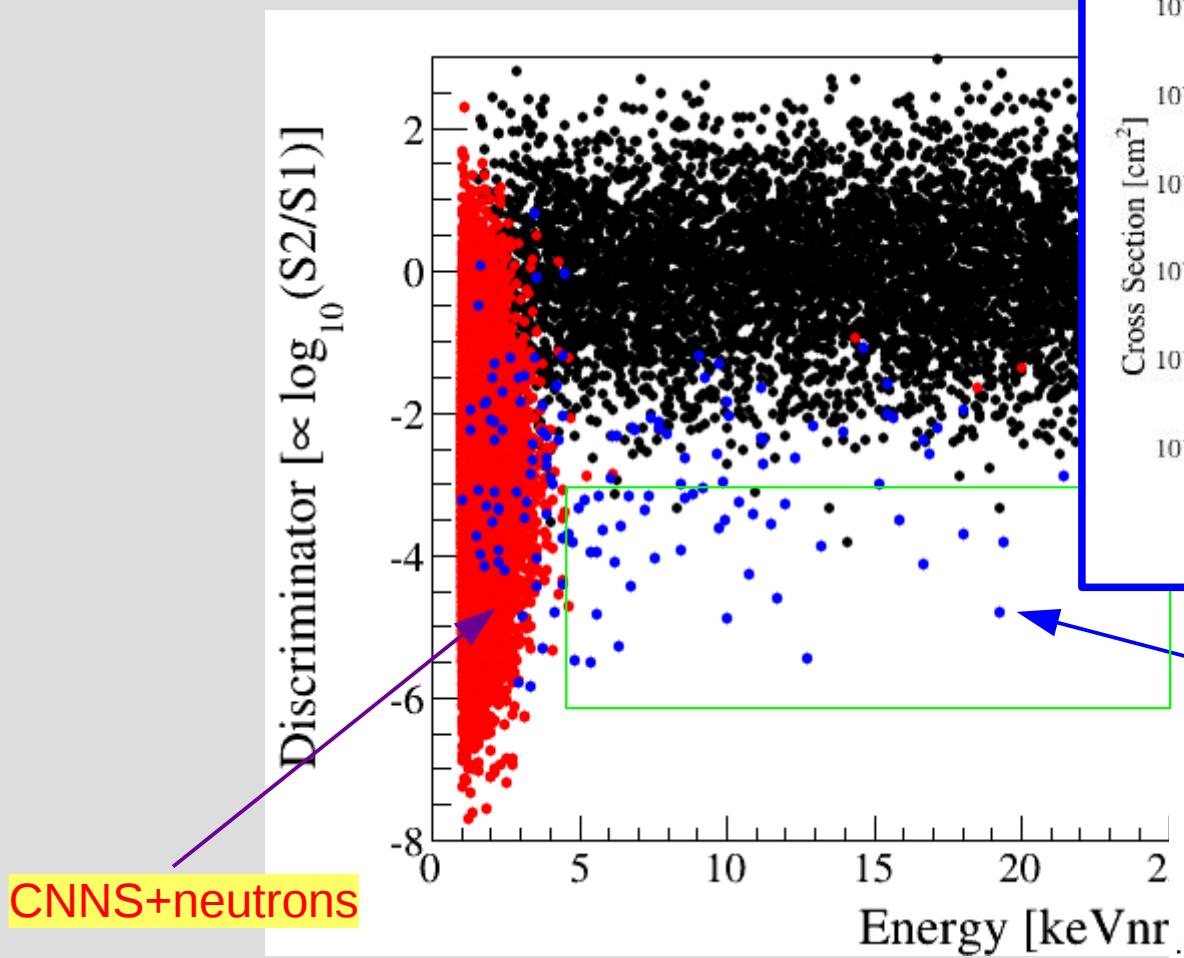

*some projects are missing...*

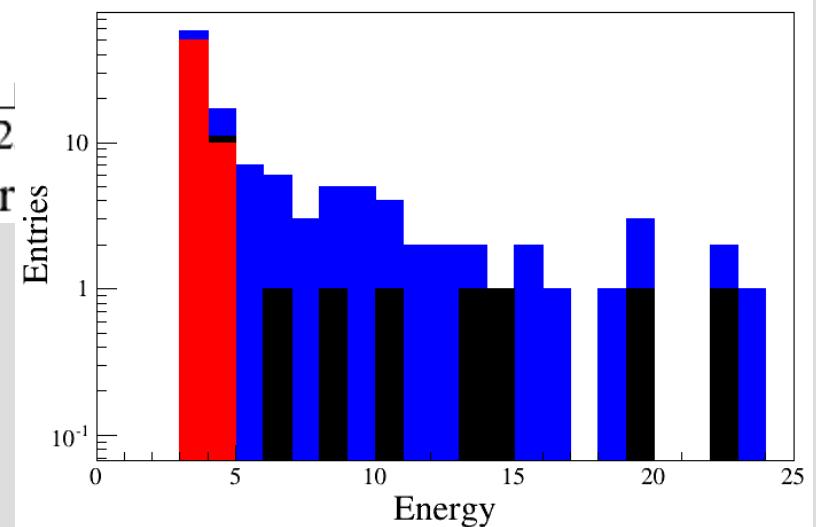

# WIMP Detection

# WIMP Spectroscopy

WIMP:  $30 \text{ GeV}/c^2$ ,  $\sigma = 2 \times 10^{-48} \text{ cm}^2$   
 40 signal events in box

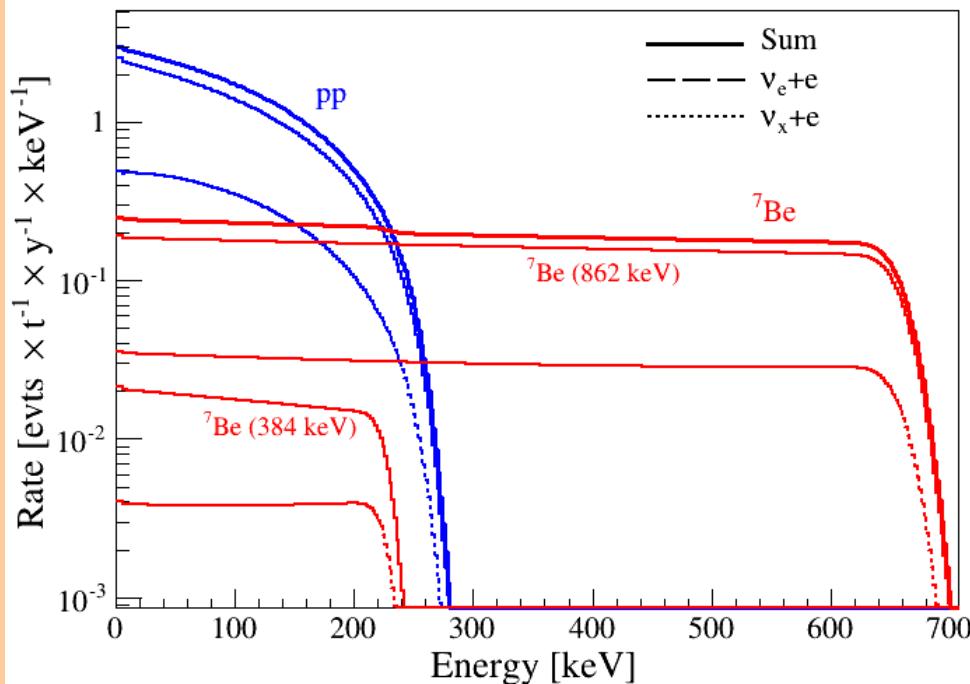

# pp-Neutrinos in DARWIN

a new physics channel!

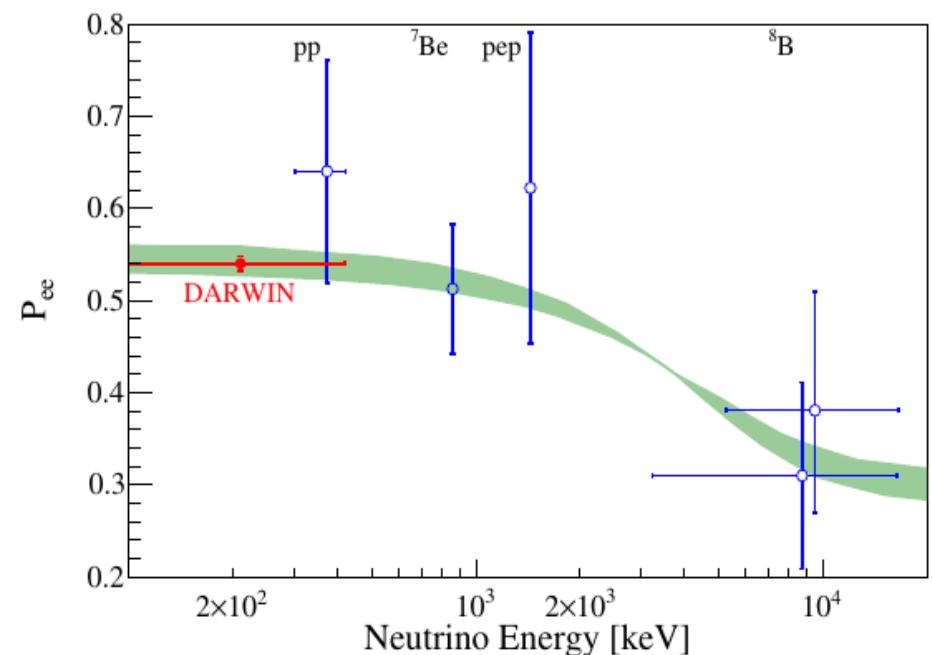

JCAP 11, 017 (2016)

Differential Recoil Spectrum in Xe

- neutrinos interact with Xe electrons  
→ electronic recoil signature
- continuous recoil spectrum  
→ largest rate at low E  
~0.26 v evts/t/d in low-E region (2-30 keV)

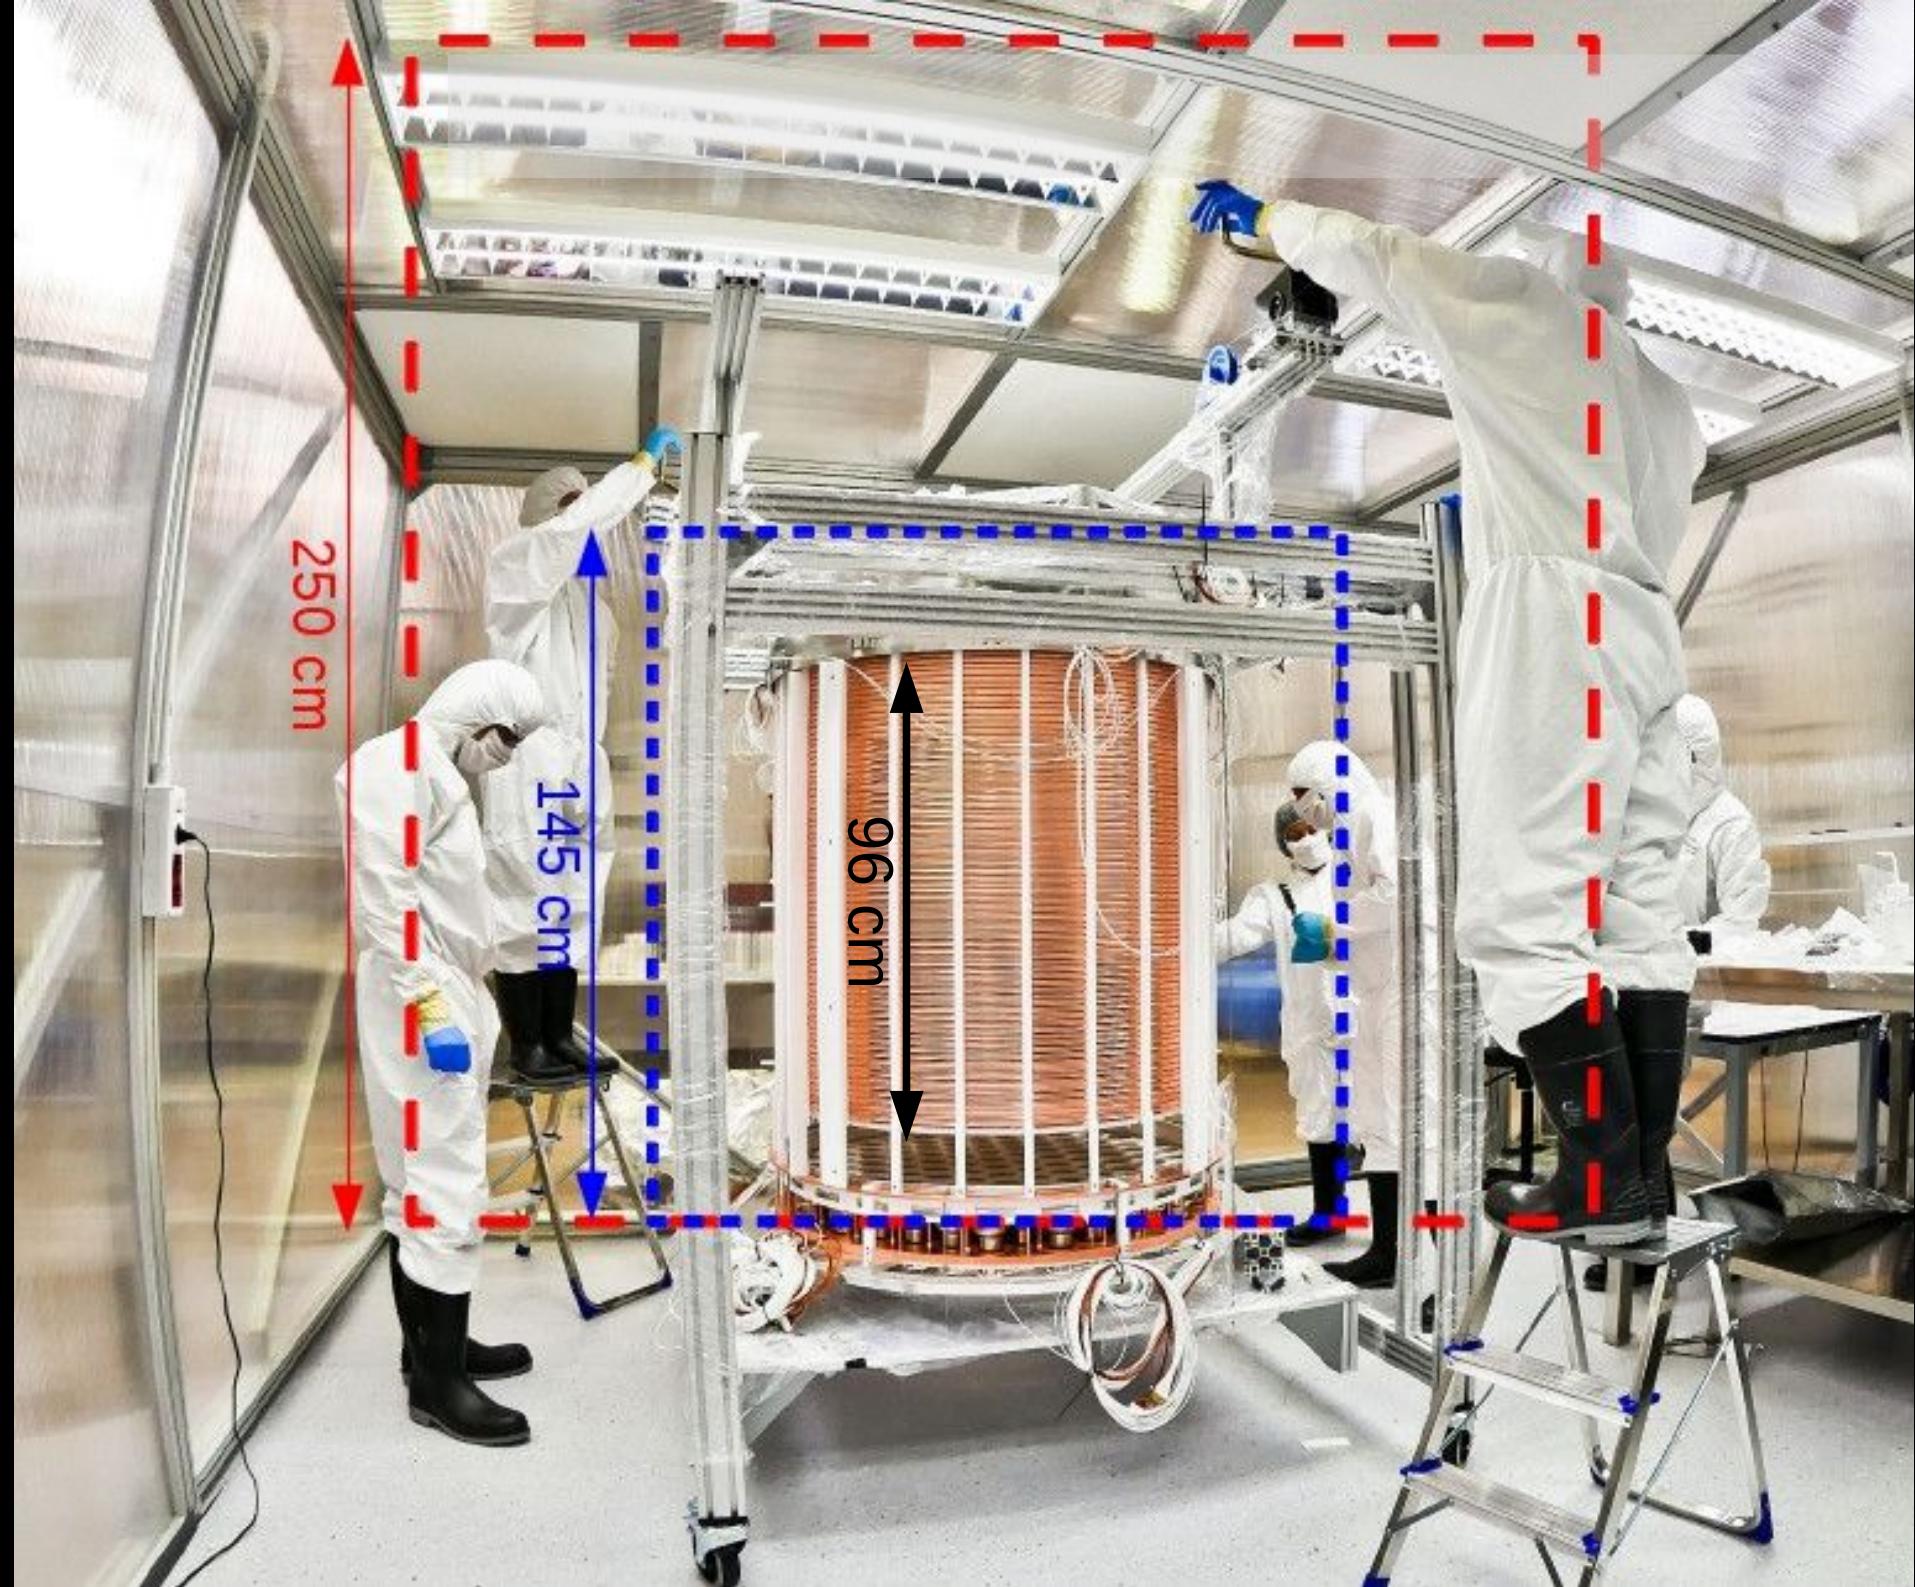

Neutrino interactions

- 30t target mass, 2-30 keV window  
→ 2850 neutrinos per year (89% pp)  
→ achieve 1% statistical precision  
on pp-flux (→  $P_{ee}$ ) with 100 t × y

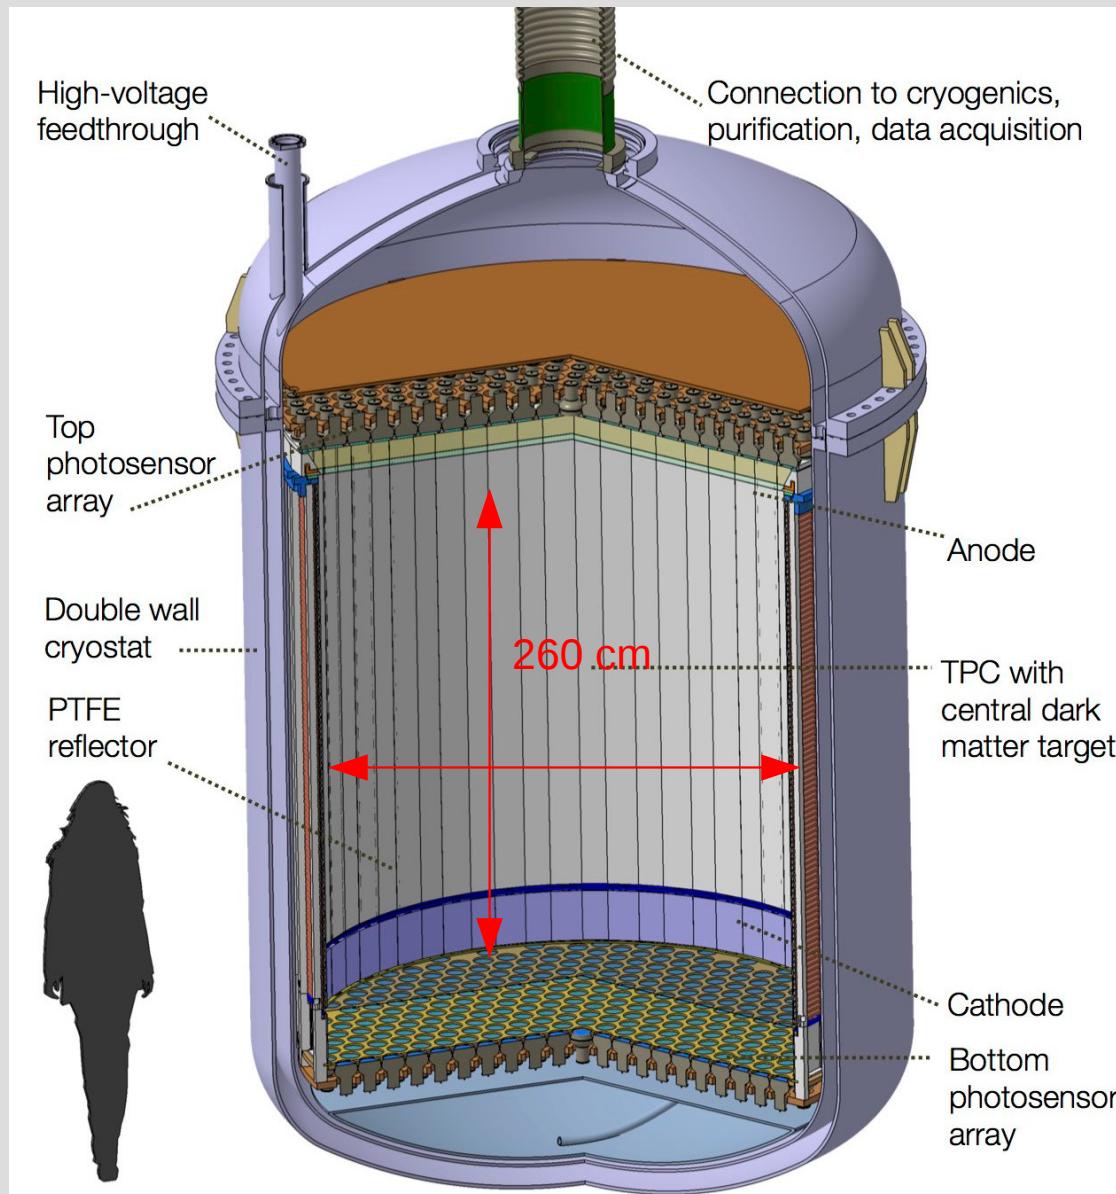

PROJETMAN - OGM  
NOM 003-87  
PORTATA t. 5

# DARWIN The ultimate WIMP Detector

JCAP 11, 017 (2016)

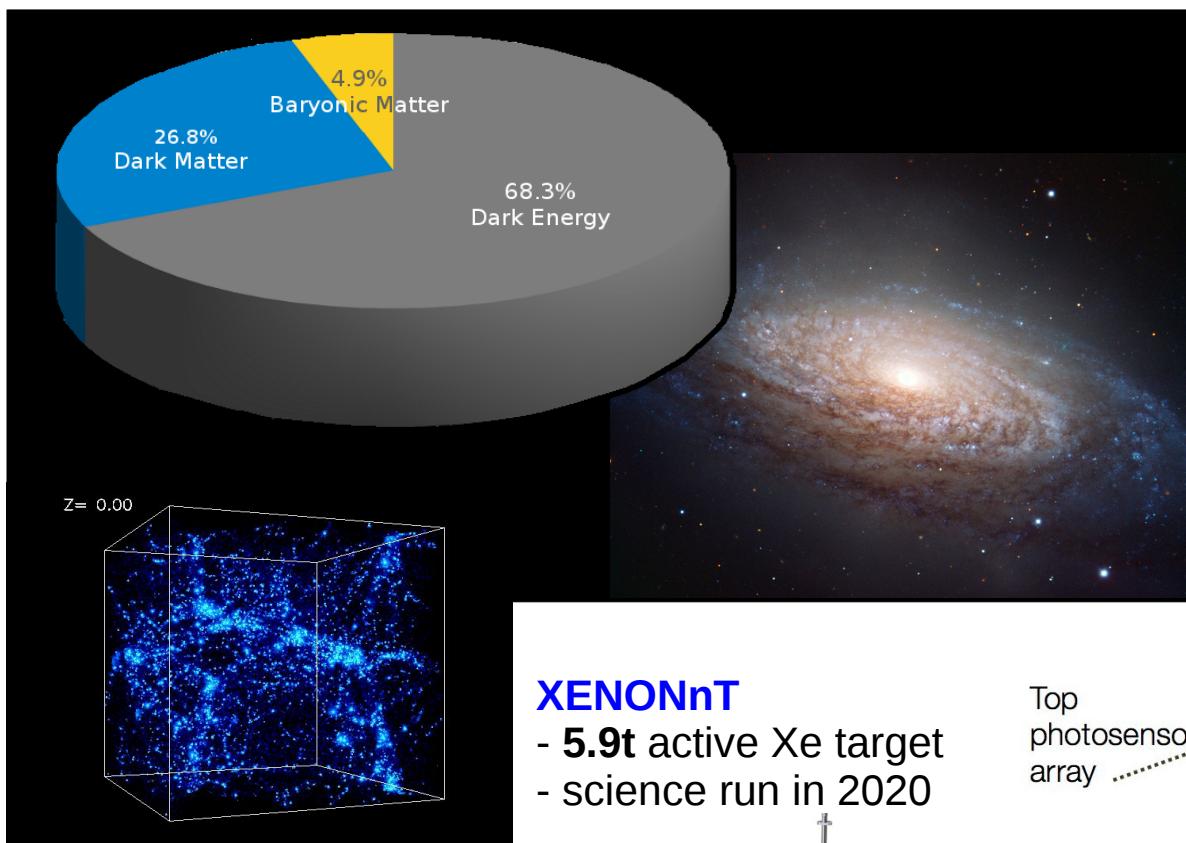

## Challenges

- Size
  - electron drift (HV)
  - diameter (TPC electrodes)
  - mass (LXe purification)
  - dimensions (radioactivity)
  - detector response (calibration, corrections)
- Backgrounds
  - $^{222}\text{Rn}$ : factor 100 required
  - ( $\alpha, n$ ) neutrons (from PTFE)
- Photosensors
  - high light yield (QE)
  - low radioactivity
  - long-term stability
- etc etc

DARWIN
